2005 Michigan Soybean Performance Report

Putting Your Checkoff To Work

For the 15th consecutive year, the **2005 Michigan Soybean Performance Report** is being provided to you through the investment of your **soybean checkoff**. We hope you find the results of the performance trials valuable in selecting varieties to maximize returns on next year's crop for your operation. This data can also be accessed at www.css.msu.edu/varietytrials/.

This publication is printed with soy ink and is compliments of the Michigan Soybean Promotion Committee.

2005 MICHIGAN SOYBEAN PERFORMANCE REPORT

D. WANG AND J. F. BOYSE, DEPARTMENT OF CROP AND SOIL SCIENCES

This report provides information on the performance of conventional and Roundup Ready soybean varieties in Michigan in 2005.

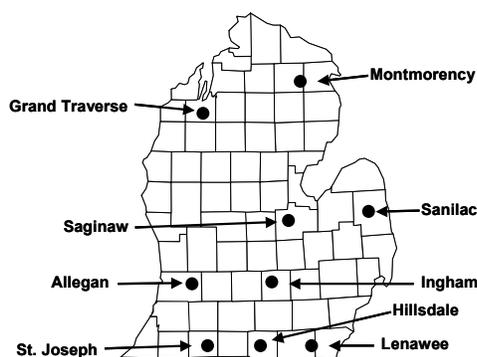

The presentation of data for the entries tested does not suggest approval or endorsement of varieties by Michigan State University.

TESTING PROCEDURES

Seven trials are reported here. The Central locations for both the conventional and the Roundup Ready trials include test sites in Saginaw, Allegan, Sanilac, and Ingham counties. The Southern locations for both the conventional and the Roundup Ready trials include test sites in Lenawee, Hillsdale, St. Joseph (Irrigated) and Ingham counties. Northern Roundup Ready trials include test sites in Grand Traverse and Montmorency counties. Thirty seed companies entered a total of 200 commercial varieties, and the Michigan Crop Improvement Association entered 3 public varieties. The cooperators, planting dates, harvest dates, and other site details for the nine locations are listed below.

Seed was planted in 6-row plots, 20 feet long with 15-inch row spacing, at a depth of 1.5-inches. The planting rate was 180,000 seeds/acre. At each location, varieties were replicated four times in a lattice design. The plots were trimmed to a length of 14 feet and the center four rows were harvested. Experimental design, data management, and data analysis were conducted with AGROBASE Generation II, (Agronomix Software, Inc., Winnipeg, Canada).

2005 Test Site County Locations

TEST SITE INFORMATION

Grand Traverse County

Nearest city: Buckley
Cooperator: Frank Lipinski
Planting date: 5-12-05
Harvest date: 10-4-05
Previous crop: Corn
Soil type: Karlin Sandy Loam
Fertilizer: 160#/A. 19-19-19
Herbicides: Pre-plant Treflan, 32 oz./A Roundup Ultra

Montmorency County

Nearest city: Hillman
Cooperator: Noel Hardies
Planting date: 5-12 -05
Harvest date: 10-11-05
Soil Type: Bergland Clay Loam
Previous crop: Corn
Herbicides: 32 oz./A Roundup Ultra

Lenawee County

Nearest city: Britton
Cooperator: David & Jason Woods
Planting date: 5-5-05
Harvest date: 9-28-05
Previous crop: Corn
Soil type: Brookston Clay Loam
Fertilizer: 250#/A 0-0-60
Herbicides: Conventional Trials – Preemerge .6 oz.
FirstRate 84DG, 1.33 pt/A Dual II Magnum
Roundup Ready Trials - 32 oz./A Roundup Ultra

Hillsdale County

Nearest city: Reading
Cooperator: Robert Lennard
Planting date: 5-3-05
Harvest date: 9-30-05
Previous crop: Corn
Soil type: Blount Silt Loam
Fertilizer: None
Herbicides: Conventional Trials – Preemerge .6 oz.
FirstRate 84DG, 1.33 pt/A Dual II Magnum
Roundup Ready Trials - 32 oz./A Roundup Ultra

St. Joseph County - Irrigated

Nearest city: Mendon
Cooperator: Roger and Anne Gentz
Planting date: 5-6-05
Harvest date: 10-7-05
Previous crop: Seed Corn
Soil type: Osthemo
Fertilizer: 150# /A 0-0-60; 75#/A 21-0-0-24
Herbicide: Conventional Trials – Preemerge 1.5#/A Lorox
50% DF, 1.33 pt/A Dual II Magnum
Roundup Ready Trials - 32 oz./A Roundup Ultra

Ingham County

Nearest city: Mason
Cooperator: Michigan State University
Planting date: 5-7-05
Harvest date: 10-10-05
Previous crop: Corn
Soil type: Capac Loam
Fertilizer: 150#/A 0-0-60
Herbicides: Conventional Trials – Preemerge 1.5#/A Lorox
50% DF, 1.33 pt/A Dual II Magnum,
Roundup Ready Trials - 32 oz./A Roundup Ultra

Allegheny County

Nearest city: Hopkins
Cooperator: Paul Puschel
Planting date: 5-17-05
Harvest date: 10-3-05
Previous crop: Corn
Soil type: Sebewa Loam
Fertilizer: 250# /A 0-0-60
Herbicides: Conventional Trials – Preemerge 1.5#/A Lorox
50%, 1.33 pt /A Dual II Magnum
Roundup Ready Trials - 32 oz./A Roundup Ultra

Saginaw County

Nearest city: Saginaw
Cooperator: Tom Hoff
Planting date: 5-10-05
Harvest date: 9-24-05
Previous crop: Wheat
Soil type: Parkhill - Kilmanagh Loam
Fertilizer: None
Herbicides: Conventional Trials – Preemerge .6oz.
FirstRate 84DG.
Roundup Ready Trials - 32 oz./A Roundup Ultra

Sanilac County

Nearest city: Sandusky
Cooperator: Gerstenberger Farms, Inc.
Planting date: 5-11-05
Harvest date: 10-5-05
Previous crop: Corn
Soil type: Parkhill Clay Loam
Fertilizer: None
Herbicides: Conventional Trials - Preemerge 1.5#/A
Lorox 50% DF, 1.33 pt/A Dual II Magnum
Roundup Ready Trials - 32 oz./A Roundup Ultra

GROWING CONDITIONS

Excellent weather conditions in early May resulted in all sites being planted by May 18th.

- **Grand Traverse** and **Saginaw** Counties had reduced yields because of dry weather during flowering.
- **Sanilac** County received approximately 4” of rain within days of planting, compacting soils and reducing stands. This resulted in a higher C.V. (coefficient of variation) for the trial.
- The **Ingham** County site was on variable soil type and had little rainfall during flowering. This resulted in a C.V. (coefficient of variation) too high for a precise trial. This trial site (Ingham County) was not included in the publication.

USING THE DATA

Results are presented in Tables 1 through 7.

Yield: Yield is expressed as bushels per acre at 13% moisture and is reported as single and across site means for 2005. Two and three year means are also presented when applicable.

Maturity Date (MAT): The reported values (month-date) represent the means (rounded to the nearest day) of all reps at all sites. Entries were considered mature when 95% of the pods had attained their final color and would crack under finger pressure. Additional field drying was required before the plants were ready to harvest.

Height: Plant height, reported in inches, was measured at maturity from the soil surface to the tip of the main stem. The reported values are means of all reps at all sites.

Lodging: Lodging scores reflect the erectness of the plants before harvest. The reported values are means of all reps at all sites. Ratings are based on the following scale:

- 1= Almost all plants erect.
- 2= All plants leaning slightly, or fewer than 25% of the plants down.
- 3= All plants leaning moderately (45%), or 25% to 50% of the plants down.
- 4= All plants leaning considerably, or 50% to 80% of the plants down.
- 5= Almost all plants down.

Protein and Oil Content: Protein and oil content of the seed was determined using near-infrared reflectance and is expressed on a 13% moisture basis. The analysis was done on seed from a single replicate from the Ingham and Saginaw locations for the central trial and the Ingham and Lenawee locations for the southern trial.

Phytophthora Resistance: Information on the presence of phytophthora resistance genes was provided by the organizations entering varieties. Varieties denoted with:

- 1a are resistant to phytophthora Races 1, 2, 10, 11, 13-20, 24, 26 & 27.
- 1b are resistant to Races 1, 3-9, 13, 15, 18, 21, & 22.
- 1c are resistant to Races 1-3, 6-11, 13-15, 17, 21, 23, 24 & 26.
- 1k are resistant to Races 1-11, 13-15, 17, 18, 20-24 & 26.
- 3 are resistant to Races 1-5, 8 and 9.
- 6 are resistant to Races 1-4, 10, 12, 14-16, 18-21 & 25.
- 7 are resistant to Races 12, 16, 18 & 19.

Soybean Cyst Nematode Resistance (SCN): Seed Companies that screen varieties for SCN resistance have indicated if the variety has known susceptibility or resistance

- R – Resistant
- MR – Moderately Resistant
- S – Susceptible
- MS – Moderately Susceptible

These notations followed by a number indicate the identified cyst nematode race

SELECTING A VARIETY

LSD (least significant difference, found at the bottom of each data column) values are useful when comparing two varieties in the same table. If the difference between two varieties is less than the LSD value, this difference is probably due to chance or minor environmental differences. However, if the difference between two varieties is greater than the LSD, there is a 95% or greater probability that the difference in performance is due to the greater yield potential of one variety. Valid comparisons can only be made between averages in the same column. The C.V. (coefficient of variation, found at the bottom of each data column) is indicative of the trial precision. Lower C.V. values indicate more precise trials.

The primary consideration in selecting a variety is yield. When evaluating a variety, consider yield performance over locations and across several years, if available. Considerations other than yield are also important in selecting a variety. It is especially important to select a variety that will mature before the first frost in the fall.

The degree of lodging varies among varieties. Lodging ratings should be used to evaluate potential harvest losses. Growers who have experienced lodging in the past and have had harvest problems may want to select a more lodging resistant variety. Alternatively, a variety susceptible to lodging may be planted at a slightly lower population to increase standability.

Growers should note seed size when selecting planting rates. Planting rates should be based on number of seeds per acre and not on pounds per acre.

It often benefits growers to select a few good varieties for planting each year. Yield determination and careful field evaluation during the growing season will add to the grower's knowledge of variety performance and allow for better selection.

SEED TREATMENT

Treated soybean seed submitted for Michigan State University's Soybean Performance Trials are noted by abbreviation in the 'TMT' column. Questions concerning treatments should be directed to the seed company. Contact information can be found in the 'Directory of Companies'.

Treatment Code:

- AM = Apron Maxx (Maxim)
- AM-C = Apron Maxx & Cruiser
- C = Cruiser
- EN = Encase
- SG = Soy Guard

SPECIALTY SOYBEAN VARIETIES

Sixteen special-use varieties were tested in this year's performance trials. This information will help soybean growers compare the potential profitability of special-use varieties to that of conventional varieties. ADM281, DF Seeds DF222, Dairyland DSR-218, Hyland's Belmont, Carter, Clancy, Claremont, Crown, Crystal, Sherwin, Sinclair, NK Brand S20-F8 and Vinton 81 are food-grade varieties. Zeeland Farm Services ZFS 211 LS and ZFS291 LS are low-saturated fat soybean varieties that have been grown under contract for oil production. Zeeland Farm Services ZFS 271 LL is a low-linolenic acid soybean. Be sure to contact your buyers to determine which special-use varieties they will accept before signing contracts or ordering seed.

Are you losing yield to diseases and insects?

Check out www.planthealth.info for all your soybean related disease and insect challenges.

- Look at yield-lowering diseases and pests
- Receive current, science-based, management options
- www.planthealth.info is linked to all university Web sites across the Midwest, including M.S.U., centralizing all known information about a disease.

2005 MICHIGAN WHITE MOLD SOYBEAN PERFORMANCE REPORT

D. WANG AND J. F. BOYSE, DEPARTMENT OF CROP AND SOIL SCIENCE

This report provides information on the performance of soybean varieties when challenged with white mold, which is also known as Sclerotinia stem rot.

TESTING PROCEDURES

The white mold test was grown at one location (Ingham) with four replications. The Ingham County site was inoculated with white mold sclerotia and irrigated to promote infection. The entries were tested in plots planted 20 feet long, 6-rows wide with a 15-inch row spacing. The planting rate was 210,000 seeds/acre. Varieties were replicated four times in a lattice design. The test included 85 commercial varieties entered by 16 seed companies and 2 public varieties entered by the Michigan Crop Improvement Association. Twelve experimental varieties were tested from the Michigan State University soybean variety development program. The plots were planted, harvested, and rated as described for the Conventional Variety Trial.

TEST SITE INFORMATION

Ingham County

Nearest City: East Lansing

Cooperators: Michigan State University

Planting date: 5-4-05

Harvest date: 10-15-05

Previous crop: Corn

Soil type: Capac Loam

Fertilizer: 150 lbs. 0-0-60

Herbicide: Preemerge - 1.5 #/A IOROX 50% DF,
1.33 pt/A. Dual II Magnum

GROWING CONDITIONS

The Ingham County field was irrigated daily during flowering. Temperatures were above normal for the growing season causing only slight disease pressure in our field. Cool temperatures coupled with excess rainfall promote maximum disease pressure.

USING THE DATA

Results are presented in Table 8. These evaluations were done to provide information on the relative susceptibility of varieties to white mold. Although no varieties have been identified that have complete resistance to the disease, there are varieties that have lower infection rates than others when the disease is present. The selection of

varieties that have low infection rates and high yields can help growers profitably in fields where white mold infections occur.

The following traits were rated using the procedures outlined in the Michigan Central and Southern Conventional Soybean Variety Trial Report: yield, maturity date, height, and lodging. White mold levels were determined by rating 30 random plants in the center rows of each plot. Each plant was rated on a scale of 0 to 3 with 0 = no infection, 1 = infection only on branches, 2 = infection on the main stem but pod fill was normal, and 3 = infection on the main stem resulted in plant death and poor pod fill. The scores of the 30 plants rated for each plot were totaled. The total was divided by 90 (the total if all 30 scored plants were given a rating of 3) and multiplied by 100 to give a disease severity index (DSI). A DSI of 100 would be given to a plot where all evaluated plants had a rating of 3 and a DSI of 0 would be given to a plot where all evaluated plants had a rating of 0.

DSI and yield values are given as averages of the replications and for multi-year. Maturity, plant height, and lodging values are given as averages over the replications for 2005. LSD (least significant difference, found at the bottom of each data column) values are given for each test. The LSD values are useful for comparing two varieties in the same test and are explained in detail in the Michigan Central and Southern Conventional Soybean Variety Trial Report. The C.V. (coefficient of variation, found at the bottom of each data column) is indicative of the trial precision. Lower C.V. value indicates more precise trials.

SPECIALTY SOYBEAN VARIETIES

Thirteen special-use varieties were tested in this year's white mold trial. This information will help soybean growers compare the potential profitability of special-use varieties to that of conventional varieties. Vinton 81, Dairyland DSR-218, DF Seeds DF222, Hyland's Belmont, Carter, Clancy, Claremont, Crown, Crystal, Sherwin, and Sinclair and NK Brand S20-F8 are widely accepted for various food-grade uses such as soy milk and tofu production. Zeeland Farm Services ZFS 291LS is a low-saturated fat soybean variety grown for oil production.

INDEX FOR 2005 SOYBEAN VARIETY PERFORMANCE TRIALS

There were 203 varieties from 31 private and public seed companies entered in 9 county test sites in the 2005 Soybean Variety Performance Trials. Numbers within parentheses refer to the Table in which the variety appears. Company names used in association with variety numbers refer to the brand, and the numbers are the variety designation.

Our soybean checkoff.
Effective. Efficient. Farmer-Driven.

Dear Fellow Soybean Producers,

Analyzing soybean performance data to assist in the selection of varieties to plant on your farm has never been more important or complicated. Over the years we have successfully faced the challenges of the introduction of herbicide specific varieties while addressing the agronomics of white mold and the soybean cyst nematode. In 2000, another pest, the soybean aphid, was identified in most Michigan soybean producing counties with 2005 infestation levels providing opportunities to refine aphid control measures. For the 2005 crop year, Sudden Death Syndrome and Brown Stem Rot were a growing problem across Michigan and even though we did not experience Soybean Rust, we must continue to recognize its potential. It is obvious growers must look at many items for their seed selections: yield, maturity, protein content, disease resistance and more!

Change is constant in our industry. The format of this 2005 Soybean Performance Report is intended to provide basic performance information. Included is data for your review when considering yield, maturity, phytophthora resistance, white mold tolerance, SCN varieties, protein and oil content (not at all locations) as well as yield information for herbicide specific varieties. While it makes for a large report, growers can access those varietal characteristics most important to their needs. You can access the Soybean Performance Report on the web at www.css.msu.edu/varietytrials/.

The soybean checkoff program is managed by seven soybean producers from the seven soybean districts throughout Michigan. As producers, we are on the front line of the many challenges facing our industry. It is through the investment of your soybean checkoff in programs such as the Soybean Performance Report printing and distribution that we not only research grower needs but we inform Michigan producers of the research results which can then translate to greater profit opportunities.

For the 15th consecutive year, we are distributing this report FREE to you via direct mail, through extension offices, at meetings, shows, elevators, and farm supply stores, in hopes that you will utilize the data in selecting the varieties most appropriate for your farm in preparing for the 2006 planting season.

Sincerely,

Michigan Soybean Promotion Committee Directors
