

# Science Puts Curb on Oxygen, Sleepless Enemy of Industry

By Thomas M. Beck

THE layman seldom realizes that air is one of the chief trouble-makers in modern industry, but such is the case. As every schoolboy knows, one-fifth of its volume is oxygen, a gas most essential for life, but unfortunately a very reactive and corrosive substance. This property is the source

of much that is good, but it is difficult to control. The most noticeable misbehavior of air is seen whenever a house burns down; the house is simply combining with air in a highly spectacular fashion.

However, a fire can usually be extinguished by the firemen, but there is a very slow, invisible burning going on all the time around us and destroying much that is good and useful. The grocer is reminded of it whenever soap or oil turns brown and rancid, and the druggist finds out about it when he must replace certain drugs, usually of the more expensive variety, that have deteriorated on his shelves. The chemist curses it long and bitterly whenever he finds that some rare chemical on which he has spent a great deal of labor has turned gummy and useless.

But it is the motor industry that is most exposed to the ravages of oxidation. Its two chief organic essentials, rubber and gasoline, are especially susceptible. Everyone knows how a rubber band that has been vacationing for some time in a corner of a desk drawer will break instead of stretch. The air is to blame for that. And gasoline is especially vulnerable these days, when so much cracked gas is being used for its anti-knock properties. Prolonged exposure to air not only cuts down on the anti-knock rating of such a gasoline, but also increases the amount of damaging gums present.

There are a number of other factors that assist air in its evil work. Light is a notorious offender in this respect. And then there are certain common metals which when present even in almost infinitesimal amounts will speed up some of these oxidations enormously. For example, it is said that the mere contact of a small piece of copper with rubber during its processing will ruin the whole batch beyond salvage. But most of these factors are ones that can be kept under control. It is the air itself that remains the big trouble-maker.

The chemist's answer to this problem has been the development of substances known as antioxidants. These are certain organic compounds which, when mixed with the product, slow down the oxidation to such an extent that the life and usefulness of the commodity are increased as much as tenfold. And the surprising thing is the small amount of these antioxidants required for the job. Usually only a small fraction of a per cent is necessary. For example, one of the best antioxidants for gasoline is a white solid known as parabenzylaminophenol. If you were to stir some of it into gasoline it would sink to the bottom, and you would say that it did not dissolve. But at the refinery the

crude gasoline is passed through a filter of the stuff, and it picks up enough to remain pure and sweet and powerful for a long time.

There is still a lot to be found out about this problem. Most of the antioxidants have been found by a method of trial and error. The chemist cannot predict whether a certain compound or class of compounds will be any good or not. He knows that all good antioxidants are reducing agents, that is, compounds that combine with oxygen fairly readily; but it is by no means true that a good reducing agent will be a good antioxidant. In fact, some of the best reducing agents are quite useless for this purpose.

And he would be very happy if someone could tell him the way in which antioxidants act. They certainly do not act by combining with all the oxygen present; they are not present in great enough quantity to do that. Perhaps the best explanation is that most of the oxygen molecules are pretty well behaved, but that there are a very few bad actors among them, which, for want of a better term, are called activated molecules.

These activated molecules travel through the available material, for example, rubber, and whenever they collide with a rubber molecule they wreck it. In doing so the oxygen molecule replenishes its

activity with some undefined sort of energy taken from the rubber molecule, and then proceeds on its way looking for more rubber. So it moves from rubber molecule to rubber molecule and at each stop renews its ferocity with its victim's life blood. But if an antioxidant

be present the activated oxygen molecule soon collides with an antioxidant molecule, which either combines with it or takes the fight out of it (or, as the chemist says, deactivates it).

But while this problem is still

this value the apparent oxidation potential. They find that for a given industrial commodity there are certain upper and lower limits of apparent oxidation potential, outside of which a reducing agent will not be an antioxidant. Unfortunately, this potential is measured by a method so thoroughly unsound from the standpoint of pure science that the average thermodynamicist pales with horror at the very mention of it.

But the industrial chemists do not stop at even this. They break up the formulae of these reducing agents and assign a fraction of the total potential to each part. Then they reassemble these parts into new formulae and draft plans for new antioxidants. This latter procedure is even more scientifically unsound than the former. About all that the industrial chemist can offer in defense of the procedure is that it gives good results most of the time.

## IF YOU CAN'T SLEEP AT NIGHT

TRY THIS NEW WAY TO GAIN SLEEP QUICKLY ... TO GAIN NEW ENERGY NEXT DAY

### SLEEP COMES QUICKLY

To Thousands Who Take This  
Swiss Food-Drink at Bedtime

WE offer you here a way to help you gain sleep quickly. A way that thousands have tried with marvelous success. Not with drugs ... but by using a building food, namely, Ovaltine.

Hundreds of doctors recommend it because they have found that Ovaltine ... when taken as a hot drink at bedtime, usually induces sound sleep in a surprisingly short time. By this method you awaken in the morning ... not with a druggy feeling ... but clear-

eyed, alert, refreshed—with your nerves calm and mind clear.

Inducing sleep, however, is only one of the benefits you gain by using Ovaltine. For Ovaltine is remarkably easy to digest, and because of its unusual food values, it is a wonderful aid to nature in rebuilding nerve, brain, and body tissue while you sleep.

So outstanding are the results accredited to it that, during the World War, it was used as a standard ration for invalid, nerve-shattered soldiers. Thousands of people, men and women, use it regularly to restore vitality when fatigued. And it is also highly recommended by physicians for nervous, under-nourished children—and as a strengthening food for nursing mothers, convalescents, and the aged.

Get a can of Ovaltine at any drug or grocery store today. Or mail the coupon at the right for a trial supply.

SEND THIS IN AND  
SEE FOR YOURSELF  
HOW MARVELOUS  
OVALTINE IS.

#### MAIL THIS FOR 3-DAY TEST

THE WANDER COMPANY, Dept. A78  
180 North Michigan Ave., Chicago, Ill.  
I enclose 10c to cover cost of packing and mailing. Send me your trial package of Ovaltine.
