The Manicure Modernized

Motors, Disks, and Buffers
Now Whirl Away Tedium of Nail Beautification

By Eleanor Nagle

The MANICURE is a service that affords more of a pleasure in certain quarters than in others. In some, it is a fairy tale in the hands of the manicurist, but in others it is a cruel torture inflicted upon the nerves and muscles of the unfortunate. The modern manicure, however, is a different matter. It is a pleasant experience, and the operators are trained to make it so. The apparatus used is not only modern, but it is also efficient. The modern manicure is a joy to everyone who needs it.

1. Exposing hands to water. To start the process, the hands are immersed in warm water. This helps to relax the muscles and prepare the nails for the treatment.

2. Holding the hands in the water. The hands are held in the water for a few minutes to allow the water to penetrate the skin.

3. The professional manicurist applies the cream or lotion to the hands. This helps to moisturize the skin and prevent dryness.

4. Using a motor disk to file the nails. The motor disk is used to file the nails, providing a smooth and even surface.

5. The nails are polished with a buffer. The buffer is used to polish the nails, giving them a shine and gloss.

6. Inspecting the finished nails. The manicurist checks the nails to ensure they are properly shaped and polished.

From Filing to Polishing, the Fine Art of Finger Tip Grooming Goes Mechanical

Materials:

- Motor disk
- Buffer
- Cream or lotion
- Warm water
- Hands

Steps:

1. Expose hands to water for a few minutes.
2. Hold hands in the water to relax muscles.
3. Apply cream or lotion to hands.
4. File nails with a motor disk.
5. Polish nails with a buffer.
6. Inspect finished nails.

The process of manicuring has been made easier with the use of modern equipment. This makes the process more pleasant and efficient for both the manicurist and the client.
