Let them tear it up...

Warren's A-34 Kentucky Bluegrass Comes Back Faster!

Warren's A-34 Kentucky Bluegrass (Poa pratensis), grows vigorously in shade and sun alike. It is proving to be the best all round grass for use on sports-grounds, parks and recreational areas. Its ability to recover quickly from injury makes it ideal for sowing down golf tees and all those areas receiving wear and tear.

Warren's A-34 Kentucky Bluegrass will tolerate up to 65% shade when maintained at a two inch cutting height. On open sites it can be mown down to 3/8ths of an inch, still grow vigorously and retain its power to recover quickly. It is the one pure strain of bluegrass seed that will thrive in shade and sun and tolerate a wide range of soil and climatic conditions. It is not necessary to blend A-34 with seed of other species or strains and the best results have been obtained from using it neat at a low seeding rate.

Warren's A-34 Kentucky Bluegrass has been under observation by turf grass research departments of leading Universities and other research organizations in the United States and they have all given it a high rating for disease resistance and shade tolerance.

Front Cover Picture:
The Howard Bolene 1477 is one of a range of mini tractors designed primarily for garden operation, but with a 14 hp petrol engine and hydrostatic transmission it can be used in many industrial applications; in this picture it is towing a barge.

Since last December, a 1477 has been working on the Grand Union Canal for British Waterways under the control of Mr. Terry Barnett, Mechanical Inspector at the Authority’s Bulls Bridge Plant Unit, Southall, Middlesex.

The Association is affiliated to the English and Welsh Golf Unions.
The exhibition will be open from 10 a.m. to 6 p.m. on the 12th and 13th of September and from 10 a.m. to 5 p.m. on the 14th.

Admission by catalogue at entrance gate. Price 20p. At Motspur Park by kind permission of the University of London. Further details from:

Tee Shots

Golf, in France, after ten years or more of disappointment, after it had seemed set for expansion, now seems to have taken a forward turn again. A new President of the French Federation is keen on developing the game and several new courses are under discussion, though several, for the moment, will be restricted to 9-holes.

The City of Birmingham is planning to add a further 27 holes to its unique collection of municipal courses. The land is at Manwoods Farm which lies alongside the Handsworth Golf Course, our President’s home club. Mr. Bretherton is, of course, also President of the Handsworth Golf Club where there have also been recent changes providing three new holes on land closer to the clubhouse.

The new 9-holes at Berwick-upon-Tweed, an addition to the existing 9-holes, are beginning to take shape. The site is an interesting one with possibly the best-preserved earthworks anywhere in the British Isles and the whole thing only two minutes walk from the town centre.

Work should start in a month or so on the new municipal golf course at Tamworth. This will be on rather different soil and country from our Midland Secretary’s home course at nearby Whittington Barracks but will fulfil a great need in this developing town.

Best wishes to all greenkeepers at this Tournament time in the 60th year of the Association. Long may it prosper!

The Editor.

In Memorium

As we were going to press, we received the following from the Secretary of NORTH WEST SECTION:

It is with deep regret I have to inform members of the death of Jim Bridges Head Greenkeeper at Malone Golf Club Belfast, Northern Ireland. I have just learned of his passing on, and on behalf of all members of the Section I extend our deepest sympathy to Mrs. Bridges and family in their sad loss.

Jim died on the 24th May after a heart operation, he had been Head Greenkeeper at Malone Golf Club for twenty six years and was made an honorary life member after making the new Malone Course. He was the brother of W. Bridges our friend at Wallasey Golf Club and had been a member of the Association for over thirty years.

The treatment of Fungal Diseases

The CHIPMAN CHEMICAL COMPANY condenses much useful advice on avoiding and treating fungal disease.

Late Summer and Autumn marks the opening of the season for uninvited and unwanted guests of British golf greens. These are the fungal diseases and the reluctant hosts are our very hardworking turf grasses. Fungi are parasitic and being unable to synthesize organic food, attack the plant material of their host, penetrating the cell wall or entering wounds or natural openings and leaving the characteristic symptoms of disease in the grass plant when the infected cells die.

Some common turf fungi depend solely upon living grasses for support, whereas others are able to continue to survive after the host has died, living on the dead plant material. Both can produce thousands of spores capable of infecting a fresh host. In addition some fungi can form a 'resting body' which is able to persist for many years, even in unsuitable conditions and carry over disease from one year to the next. There are therefore many sources of infection, and if allowed to develop and spread these fungi can cause severe damage.

By knowing the conditions which fungi find most desirable it is possible to produce a non-conducive environment by good cultural turf management practices. It is significant that the conditions which discourage fungi and also those which most favour the healthy growth of fine grasses. Worthwhile measures can be summarised as follows:–

Aim to reduce surface moisture
- Improve drainage where necessary.
- Carry out spiking, slitting, raking, mowing regularly and at the optimum time.
- Switch dew from grass.
- Remove any barriers to the flow of air across the turf.
- Reduce shade.
- Avoid leaving grass long in winter.
- Avoid smothering turf with top dressings.

Maintain fertility and acidity
- Use balanced fertilisers at the correct time.
- Avoid the late use of fertilisers high in nitrogen as compared with other elements.

Avoid mechanical damage
- Remember that spores enter through the wounds.

Utilize preferred seed mixtures
- A mixture of different species is less susceptible than a pure sward.

Fungicides

Even when all the necessary cultural precautions are taken disease still frequently develops, making the use of fungicides essential. The ideal fungicide should be able both to kill the disease organisms and to protect from further infection, without of course injuring the grass or building up toxic residues in the soil which may become detrimental to plant growth.

It should be economical in use and easy to apply. ‘Verdasan’ is a fungicide which answers these requirements, containing 2.5% mercury, organically combined. To control
Fusarium Patch 1 oz. is applied to 40 sq. yd., either in 2-8 gallons of water or in 14 lb. of sand or finely sifted soil. Treatment should be made at monthly intervals in September, October and November, or in March and April. The same quantity is adequate for Dollar Spot which should be treated as soon as the disease appears, usually in May or June, repeating treatments at monthly intervals until late August. Ophiobolus Patch requires 2 oz. ‘Verdasan’ per 40 sq. yd., mixed as before, applied at the end of August and again at the end of October.

The use of seed treated with a fungicide such as SAIsan (containing drazoxolon) will give protection against seed and soil borne diseases such as seed rot and pre and post emergence ‘damping off’ to which small seeded grasses are susceptible.

Many new fungicides are arousing a great deal of interest. One such is based on chlorthalonil, which is a broad spectrum fungicide providing excellent control.

NON-TOXIC CONTROL HOECHST U.K. LTD.

Intensive methods of turf maintenance are often predisposing factors to fungal attack. High fertiliser usage, liming, irrigation, rolling and frequent mowing can all lead to the rapid spread of fungal diseases.

The commonest and most widespread disease of turf in this country is Fusarium Patch (Fusarium nivale). The first symptoms are the appearance of small brown or yellow patches about two inches in diameter which may extend up to one foot across and eventually join together to form large irregular patterns. Under mild moist conditions the fungus can be seen on the surface as a fine pink or white cotton-like growth.

Fusarium can occur at any time throughout the year but is most common in Spring and Autumn or during mild periods in Winter. Severe infection of Fusarium can occur under snow cover.

Corticium Disease or Red Thread (Corticium fuciforme) is common in all parts of the country and is characterised by the appearance of pink or red threads on the grass leaves. Ugly brown patches are formed from three to five inches in diameter and the fungus spreads between the grass blades binding them together in a gelatinous matt.

Dollar Spot (Sclerotinia homoeocarpa) is confined to greens laid with sea marsh turf. The sward deteriorates rapidly as red fescue is killed out by the fungus in one to two inch diameter spots which enlarge and coalesce to form irregular patches.

Recognition of these diseases in quality turf in the early stages is difficult and delay in identification of the problem can lead to unsightly turf over a long period. It is therefore a wise precaution to treat all top quality turf with a fungicide as a routine precaution.

Quintozene, available as Hoechst ‘Bras-sicol Super Wettable Powder’, has the great advantage that, unlike mercurial fungicides, it is non toxic.

The recommended rates of use are 25 lb. per acre or for smaller areas 8 oz. in 10-14 pints of water per 100 sq. yards. The first application should be made as soon as symptoms appear and repeated at monthly intervals. Cutting should always take place before spraying and over-rolling should be avoided.

SYNCHEMICALS M-C AS A TURF FUNGICIDE

The value of Mercurial Compounds such as Mercurous Chloride as turf fungicides has long been appreciated but not the fact that this material is also the active ingredient in Synchemicals M-C Moss Killer.

Synchemicals M-C applied annually for moss control also reduces the risk of outbreaks of turf diseases such as Fusarium and Corticium (Red Thread), thus from a single application annually, it is possible not only to control moss but have the basis for a preventive control programme for turf diseases.

Treatment should commence immediately the disease is detected. Synchemicals M-C applied to affected patches at the rate of 3 measures of M-C in 6 gallons of water to treat 20 sq. yds. of turf (3 measures = 3 oz.). Treatment should be repeated at monthly intervals. Synchemicals M-C has its own wetting agent.
YOUR HAND IS YOUR TOOL KIT.

Take a good look at the new Spartan 7. A special hand-adjustable gang mower that adds more cutting time, by reducing adjustment time by 75%. A single knob located in the center of the Spartan 7 adjusts the bedknife to the reel, easily, without tools.

This unique gang mower can be equipped with wheels to meet varying traction, transport and cutting requirements. From less than 1/2" to 2" cutting heights, and a cutting width of 30".

Hook 3, 5, 7 or 9 of these versatile mowers to a Toro gang-mower frame or special tractor, and you are equal to any mowing job.

Toro has servicing dealers and distributors worldwide. TORO... for over 57 years, makers of quality lawn and garden care products, automatic underground sprinkler systems, snowthrower equipment.

**CANNOCK FERTILIZERS FUNGICIDE**

Fusarium Specific is the name given to the very well known turf fungicide manufactured by Cannock Fertilizers Limited of Cannock, Staffordshire. Fusarium Specific contains mercury compounds carefully blended with a suitable carrier. Bulking with sand or compost is not necessary or recommended. One application generally proves adequate, but occasionally further treatment may be necessary.

Fusarium Patch Disease can be prevented by applying 1 oz per square yard of Fusarium Specific in the spring and especially in the autumn.

Where the disease is established, the turf should immediately be dressed with Fusarium Specific at the rate of 2 oz. per square yard. The fungicide is best applied when the grass is moist with dew, but no watering should be undertaken.

**MAY AND BAKER FUNGICIDES**

‘Mersil’, based on mercuric chloride and mercurous chloride, is a fast-acting long-lasting treatment for prevention and control of Fusarium patch, red thread (corticium) and dollar spot. Formulated for use in sprayers, the product has the added advantage of giving good control of moss.

‘Maysan’, an organo-mercurial preparation for use against Fusarium patch and red thread (corticium), is a more economical preparation when used at 2½ oz per 100 sq. yd. although heavy infections may need more frequent applications.

Full details and recommendations for these products and many others are given in a Turf Protection wallet available free of charge from May and Baker Ltd. Dagenham, Essex RM10 7XS.

The following are extracts from their Fungus Control chart:—

<table>
<thead>
<tr>
<th>Disease</th>
<th>Season found</th>
<th>Predisposing conditions</th>
<th>Principal grasses</th>
<th>Cultural control</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fusarium patch</td>
<td>Autumn, Winter, Spring</td>
<td>Dull, moist weather, often under snow cover</td>
<td><em>Poa annua, Agrostis and Festuca spp.</em></td>
<td>Avoid heavy liming and late nitrogen applications. Improve drainage and reduce surface moisture.</td>
</tr>
<tr>
<td>Red thread</td>
<td>During growing season, but usually in late summer</td>
<td>High temperatures</td>
<td><em>Festuca spp.</em> mainly, but other species may be severely attacked</td>
<td>Increase nitrogen applications in summer.</td>
</tr>
<tr>
<td>Dollar spot</td>
<td>Any season, but usually in late summer</td>
<td>Cool, wet periods</td>
<td><em>Festuca rubra</em> spp.</td>
<td>Increase nitrogen applications during summer but avoid late applications.</td>
</tr>
<tr>
<td>Ophiobolus path</td>
<td>Late summer, autumn and winter</td>
<td>Dry weather</td>
<td><em>Agrostis</em> spp.</td>
<td>Remove patches and re-turf or re-sow with <em>Poa pratensis</em> or <em>Festuca rubra</em>. Use acid nitrogenous fertilizers.</td>
</tr>
<tr>
<td>Fairy rings (type 1)</td>
<td>Spring to winter</td>
<td>Dry environment</td>
<td>—</td>
<td>Increase fertilization in summer. Treat turf by prickling and watering.</td>
</tr>
<tr>
<td>Fairy rings (type 2)</td>
<td>Summer to early winter</td>
<td>Dry environment</td>
<td>—</td>
<td>Increase fertilization in summer. Irrigation will also be of benefit.</td>
</tr>
<tr>
<td>Slime moulds</td>
<td>Autumn and early winter, Attacks may occur with less severity during other periods in the year</td>
<td>Wet and humid</td>
<td>—</td>
<td>Improve drainage. In severe cases it may help to clean turf with a stiff broom.</td>
</tr>

</table>

Dry dressing is a less common technique and is usually reserved for the application of inorganic mercury-based compounds. The active material is usually applied in a carrier, such as sand or fertilizer, to effect uniformity of spread. Dry applications should be watered into turf to avoid 'scorching' of foliage.

Fungicides in solution or suspension provide certain advantages compared with the powder forms since they make possible greater accuracy and uniformity of distribution; thus providing more precise control and guarding against severe localized damage.
