BOMFORD BANDIT FLAIL MOWER

Unchallenged on golf courses, parks and sports ground outfields. The Bomford Bandit mows and mulches in one pass, cutting a broad swath 67 inches wide and covering 2/3 acres per hour under normal conditions. Fits any tractor over 30 b.h.p.

Flail Knife cutters – are robust and do not require sharpening. Mulching action swiftly rots material – avoiding after collection problems and grass lumps affecting ball play.

BANDIT 2500 model available with a big 8' 3" cutting width.

Tee Shots

We are hoping that Clifford Wagoner and David Gourlay, Presidents respectively of the American and the Canadian Golf Course Superintendents' Associations will be attending the International Greenkeepers' Tournament sponsored by Ransomes on October 2nd and 3rd. If they can make it, they are more than welcome. The form of the Symposium on the day after the Tournament is also taking shape with six papers by specialists, each followed by a general discussion which an official panel will begin. Quite a number of inquiries from interested parties have already been received. An application form appears in this issue.

On the subject of Paul Voykin's article last month, those who attended the last Annual General Meeting at St. Annes will remember that a test vote on whether members preferred to be called Greenkeepers or Superintendents came out just about even. But what are the alternatives? The Scottish equivalent of 'steward' is 'club-master' and 'green-master' would sound very well if it were not reminiscent of - footwear, is it? 'Links supervisors', as at St. Andrews, is very impressive though purists would cavil at the indiscriminate use of 'links', inland. 'Course supervisor' or 'course master' sounds too much like the race-course. What about 'B.A.C.C.? British Association of Course Custodians'? No, I don't think so. (Nor 'B.I.L.C.' either.) Somebody

even suggested 'Course Curator', which sounds rather dusty.

No! As Mr. Voykin said, there is nothing wrong with 'greenkeeper'. But it should perhaps be carefully separated. 'Green (pause) keeper'. The keeper of the green - a very honourable and exact title. It only goes awry when people talk about Greenskeeper just as they talk of a Greens Committee sometimes. But are 'course' and 'green' easily interchangeable? The 1893 Golfing Annual talking of Bridge of Weir says: 'The *course* which was laid out (etc., etc.) is equal to any green in Scotland.' And again of Crawford: 'The *green* which consists of 18 holes is an excellent inland *course*. . . .' and finally, at Grantown, 'The Ladies have an excellent nine-hole *green* which is looked after by the keeper of the gentlemen's *course*.'

Are you a greenkeeper or a course keeper?

The Institute of Groundsmanship's International Exhibition '73 looks like being bigger than ever. Help to make it a bigger attendance too. You will find it interesting and helpful.

September 18th, 19th and 20th are the dates from 10 a.m. to 6 p.m. (5 p.m. on 20th).

R. Tempest (Southern Section) is organising a big Dinner and Dance on October 27th at The Grasshopper Inn, just west of Westerham in Kent on the A25. The party starts at 7 p.m. and tickets will cost £2.50. Dress is informal and early application is requested so that numbers can be finalised early.

THE
NEW
sisis AUTOCRAT

The new SISIS Autocrat is the ideal aerator for all fine turf areas — golf greens, bowling green, etc. The Autocrat gives fast coverage because of its great manoeuvrability (turns in its own length) its 3 ft. width and its speed of operation. A 600 sq. yd. golf green can be tined in 30 minutes and an average bowling green in 1½ hours.

All controls are accessible from the operating position behind the machine and a self-release control lever is fitted for maximum safety. Depth adjustment up to 4 ins. is quick and simple without tools. There is a separate control for disengagement of the drive to the tines and quick transfer to the transport position without tools. Standard SISIS Auto-Turfman tines can be fitted giving the choice of slit tining, solid tining or hollow coring.

Top Dressing

James Bradbury
Sports Turf Consultant

Hommersteeg Seed Company Limited
One of the essential tasks in the Autumn programme of Golf Greenkeepers is the application of top dressing to the greens and tees; whatever time has been spent on early-autumn renovation work, the time given to the final operation of applying the dressing is of the utmost importance.

The main purpose of applying top dressing to turf is to improve the physical condition in which the root structure can expand in the coming autumn and winter months, and to provide a resilient, even surface for future play.

What does the average top dressing consist of? Quite often this depends on where the course is sited – is it near the coast, is it an established course, is it one of the many new courses – with its multitude of problems (usually caused by modern construction methods) – passed on to the greenkeeper? Some courses have greens which vary considerably in their make-up, especially on some heathland. All these problems will have completely differing requirements, and any young greenkeeper with such complex problems should seek advice from local courses, where experienced greenkeepers are usually only too pleased to offer sensible advice, if approached in the right manner.

On the seaside links the greenkeeper will use the local dune sand and old turf from repairs; close contact with local building contractors (who themselves are perhaps keen golfers) usually means a supply of local soil. Farmyard manure, if available, is also

incorporated, along with grass clippings from the course. The inland links, of course, only need change to local pit sand, and some courses have a source of supply on their own links. Many pit sands, along with the dunes sand, have a slight lime content, some more than others. When this is so, and the quantity of calcium is known, some adjustment for this should be made in the fertiliser programme; many inland courses will not find soil easy to acquire, and care should be taken that the pit sand and the soil used have a very low clay content. Anyone within reasonable distance of a sugar-beet factory would be well advised to inquire as to the availability of soil from the washing plant.

The make-up of most top dressing suitable for greens and tees is usually 50 per cent Dune or Sharp sand, 40 per cent light loam with a low clay content, 10 per cent fine peat. Some greenkeepers apply 1 cwt. of pinhead charcoal to each ton of screened compost; all compost must pass through 3/16 in. or 1/4 in. riddle mesh, and screening is best done in a dry shed or barn, when the staff can be occupied on rainy days. But wherever one is sited, it is important when making the compost heap to prepare it in layers some 6 in. to 9 in. thick. On some courses the heaps must be nearly 30-ton capacity. It is a must – to assist in the breakdown of the materials – to turn the heaps at intervals of 9 and 16 months. It is usual to take two years to really break them down into well-rotted humus-forming material. In the old days the turning of the heaps was no easy and pleasant task, but with the modern tractor with its front-mounted bucket, it is relatively easy.

Many very experienced greenkeepers incorporate light dressings of lime and sulphate of ammonia between layers, to assist the breakdown of the organic matter; others do not agree, being firmly convinced that the nitrogen released with the top dressing en-

Dear 'Besieged' of Tunbridge Wells...

If it's any consolation, you are not alone in your difficulties.

Every week, groundsmen and greenkeepers write to me from all over the country, worried about the state of their turf; and the effect it's having on their players.

I tell them that what they really need is a proper turf service. The best one I know of is operated by Fisons of Cambridge.

Not only do they offer an unusually fine range of products, but something that is invaluable in this day and age – a sympathetic ear.

They'll send a man round to see you, free. You can talk things out and sort things out. (All their people are thoroughly trained in all aspects of turf culture.)

Then he'll recommend the best course of action in your particular case; although, of course, you'll be under no obligation.

Anyway, why don't you get in touch with them yourself? The address to write to is: Fisons Ltd., Recreational and Industrial Dept., Harston, Cambridge, CB2 5HU. Or you may call them at 0223 870312.

Meanwhile, may I suggest a stout padlock?

The complete fine turf service.

FISONS
Fisons Agrochemical Division

courages soft growth and brings on fungal diseases such as Corticium and Fusarium during a mild autumn. Others contend that the excess lime alters the P.H. and encourages clover and worms. Certainly this period after top dressing does cause troubles with fungal diseases for some greenkeepers, but more often the cause of the trouble is one of the following: the top dressing was applied too thickly and not worked in; it was done under wet conditions; soil with a high clay content can smother fine grasses; fine sand which forms a layer and is not easy to work into the surface. I personally think the main cause of top dressing troubles is lack of scarification and aeration; it is an essential part of autumn work to do both scarification and aeration correctly, essential to allow oxygen to the plant root structure, and top dressing should never be applied to turf if it has a growth of grass exceeding 3/16 in.

Many greenkeepers simplify the making of dressing by purchasing a ready-made product; many of these are a boon to the greenkeeper with no resources to stack into heaps, or with a limited staff unable to spare the time to gather material. Some of these ready-made dressings vary considerably from one brand to another; some have a very high regard of fine peat, another a large proportion of sand; whichever type is chosen, if found to be satisfactory – stay with it – don't chop and change, as long as the product remains constant.

I do think a lot of serious green trouble is caused by applications of straight dressing, such as one year sand, one year peat, and I am convinced that all dressings must be thoroughly mixed together; to apply straight dressing will cause a build-up of layers of these materials under the sward; this will eventually lead to hard-capped greens of uneven pace, and on this surface players will have great difficulty making the ball stop, and unless regular seration is prac-

tised it is nigh impossible to get water into the green. If peat is the dominant factor, just the opposite can happen, soft spongy greens; thatch starts to build up unless regular scarification is carried out. Both methods lead to major troubles; root action is restricted, the sward becomes stunted and sparse and benefits very little from fertiliser when applied, and soon one is faced with desperate measures – should one re-lay the greens or will a combined scarification and hollow tining programme be sufficient – result, the green is out of play for a considerable time. The decision to undertake either method on some heavily used courses would almost require an act of Parliament! Look for layering when changing holes, and plan accordingly.

Some greenkeepers mix into the top dressings autumn fertiliser and apply to the green. I have reservations on this method, and fail to see how time is saved or how one can apply the fertiliser equally. I am sure a dressing of it can be applied more easily and quickly to a green by modern methods, or by hand if no spreader is available, than by mixing so many cwts. to so many tons of compost. I would recommend that fungicide be applied to the green before any top dressing be used, that all dressing be in a fairly dry state, and it is essential that dry conditions prevail during the operation to assist in working the dressing into the base of the sward. What method you adopt to put on the dressing is your choice; some use wooden lutes, others Trulutes, and to still see the experienced man casting with a shovel, working against the wind with a flick of the wrist as he casts, is something the machine age cannot compete with. As each green is covered I would recommend it be finished off with a steel drag mat pulling both ways across the green; it is most essential to work the dressing in thoroughly.

Usually, 3 to 4 lb. per sq. yd. is a

TOP QUALITY TURF DOES NOT GROW . . .

. . . **WITHOUT** the use of the finest seeds and fertilisers.

Parkers have spent many years perfecting their VERDANT range of GRASS SEEDS and FERTILISERS which is why they are used by leading groundsmen and greenkeepers everywhere.

Why make do with second rate turf when you could have a VERDANT SWARD.

And once your sward is established Parkers can provide you with a complete range of materials and equipment to ensure that this perfection is maintained.

People who **KNOW** go to **PARKERS**

Why not join them on Stand 3, Avenue F, at Motspur Park, where a warm welcome will await you?

PARKER & SONS (Turf Management) Ltd.,
Worcester Park, Surrey, KT4 7NF
Telephone 01-337 7791 01-337 0861 (10 lines)

sufficient dressing to apply at any one time; a green of around 500 sq. yd. would take about 18 cwt. of compost, but should the green have been hollow tined this operation done by hand can remove some 10 to 12 cwt. of cores, and allowance should be made for two dressings to restore a true surface; allow some four to six weeks between dressings, always drag mat after spreading; I prefer a steel mat to a brush, the mat following the contours of the green much better. It is necessary to sterilise top dressing, often an expensive task and labour can be very involved; it does ensure weed-free compost, how essential that is on strong healthy sward is not easy to judge, but on poor thin swards some weeds could be worked in and be troublesome the following summer.

News

Cambridge Soil Services combine expert technical knowledge with very extensive practical experience. This, together with the research and development constantly carried out in their own laboratory, workshops and trial grounds at Cambridge, enables them to provide the best possible answers to questions of sportsfields drainage, soil conditions and grass growth.

This year their main feature at Motspur Park is the new Triple Sand Injection machine they have de-

veloped. By using this entirely original patented method they are able to carry out highly effective sand slitting at a fraction of its former cost yet only causing the very minimal of surface disturbance. Many First Division Football pitches, County Cricket Grounds and Golf Courses have been treated as well as sportsfields and recreational areas of Local Authorities.

The Parker 1973 exhibit at Motspur Park will be of particular interest to Golf Greenkeepers. The company report a continued increase in their range of Verdant Grass Seeds and Fertilisers. In addition, the company are London and Southern counties distributors for the Hommersteeg Seed Co. and responsible for the selling and distribution of Pedigree Grass Seed to Clubs within the area.

The latest machines from Sisis will be on show including the Sisis Autocrat, an attractively priced self-propelled Aerating machine ideally suited for golf greens. The well-known Parkamatic Self-Travelling Sprinkler will be on show and finally the Ransomes 67 in. Ransomes-Hahn Tournament Triplex. This machine has been supplied by Parkers to some of the leading Clubs in the South of England including Walton Heath who possess two.

A warm welcome is guaranteed to all their friends at Stand No. 3, Avenue 'F'.

International Golf Greenkeepers Tournament

The first ever
**International Golf
Greenkeepers
Tournament**

to be held at
Woodbridge, Suffolk
(by kind permission of Woodbridge
Golf Club)

**Wednesday
October 3rd 1973**

Teams of three have
been selected from
Canada, Eire, England,
Europe, Scotland,
United States and
Wales.

The Tournament is a
36 hole Stableford
event. The winning
team will hold, for one
year, an inscribed
silver salver.
Each member will also
receive an inscribed

OCT. 3

tankard. Each member
of the second and third
teams will receive an
inscribed tankard.

Plus a comprehensive
exhibition of the most
advanced grass
machinery available
today, with expert
consultants in
attendance.

Excellent car parking; bar and
luncheon facilities.
