Tackling heavy

Grass doesn't grow on busy streets, least of all where golf's infantry patrol and armoured divisions proliferate. However, until every green chairman in the land 'bites the bullet' and imposes a total trolley ban in winter the problem will escalate. STUART ORMONDROYD offers advice which may help to alleviate the damage. His timely comments suggest re-routing is a partial answer, prevention better than cure...

Aeration & Drainage Services

recommend the use of AQUACELL prior to verti-draining, and offer the following

1. AERATION
Verti Drain hire/Twose Turf Conditioner & Robin Dagger - we are, at present running 4 Verti Drains (various sizes) and can offer tine sizes from ½" diameter by 12" long at 2 inch centres, up to 1" diameter by 16" long at 4 inch centres. Also available, Hollow tines. Therefore we can cater for any Verti Draining need such as Greens, Tees and Fairways, etc. Twose - this machine operates by way of seven vibrating blades which are pulled through the ground in a similar fashion to small mole ploughs, therefore relieving compaction and improving surface drainage. Robin Dagger - This very light and portable machine injects oxygen into the soil and around the roots.

2. DRAINAGE/SANDSLITTING
Wizz Wheel Trencher + Backfill sand/gravel hopper this is to be available on a weekly rate (min. hire 3 days) should you just require trenches excavated to be backfilled by yourselves, or, quotations can be submitted for complete sand slitting/drainage programmes including 'Hitek' stripdrain.

3. CONSTRUCTION/ALTERATION
Should you find the work load too great on your own greenstaff regarding construction/alterations of greens tees and bunkers, etc. we would be pleased to submit a quotation for such projects.

FENDRESS™
BRITAIN'S No. 1
GOLF AND BOWLING GREEN TOP DRESSING

- Finest Quality soils
- Minimal clay and silt fractions
- Washed lime free silica sands with correct particle size
- The correct pH to encourage fine grasses
- Consistent quality for over 10 years
- Delivered ready for immediate application
- Root zone mixes, made from the same high quality materials. Delivered ready mixed or separately for blending on site.

Also available: Top Dressing Sands, Bunker Sands, washed grit or kiln dried sand for verti-draining
In recent times there has been a significant upsurge in course usage which, in the last two years, has even spread to the more isolated country and island golf courses in remote parts of Ireland and Scotland. The increase in the volume of traffic is largely due to organised parties and visitors as well as additional competitions and an increase in membership playing more often, especially during the winter. Whilst swelling the Club's coffers is very welcome, the net result for the head greenkeeper is one of year-round wear and the associated erosion this brings.

The implementation of routine renovation work to promote recovery on worn areas should be an integral part of the management programme, but the primary aim must always be prevention before cure. Allied to this point is the often overlooked aspect of educating golfers to the objectives of wear control through communication. This can take the form of a monthly newsletter, pinning up information on the members notice board, inserting a leaflet with the subscription renewal as well as talks given by the head greenkeeper and members of the committee. Indeed, the general membership should be encouraged to understand the importance of any reasoning behind management carried out on the course, eg. observing re-routing markers. In this way, golfers are much more likely to abide by the instructions rather than flaunt them.

For those involved in new products it is vital that consideration be given to spreading wear during the design stage before construction starts. On the one hand course layout must incorporate feature and a degree of difficulty, but allowance must be made for alternative entrance and exit points from tee to fairway, fairway to green and green to tee and that they are made as wide as possible. Smooth contouring of surround banking will prevent scalping and providing sufficient area of putting surface for pin positions will enable wear to be spread over a greater area. With a similar aim in mind, banking, tree and bunker placement should not be excessive. In addition, an appropriate depth of a free draining growing medium for tees and greens is essential, bearing in mind compaction and turf wear are closely linked together.

Turning to practical management, an ongoing programme is vital in reducing the effects of turf wear, especially in respect of a package of aeration treatments to relieve compaction and improve drainage. Consequently, routine maintenance must be geared to favouring the deeper rooting, finer grasses, namely fescue and bent, which, in an open, free draining soil, will clearly be better adapted to withstand foot traffic, machinery and trollies than stress susceptible annual meadow grass growing in a compacted, ill draining medium. Turf damage on green surrounds can also be reduced by confining tractor mounted equipment, primarily mowing, to fairways, mowing instead with a ride-on Triple Mower. Developing larger aprons is another aspect that will help here as well as keeping trollies away from green perimeters.

Any greenkeeper will tell you that golfers invariably take the shortest possi-
Golfers invariably take the shortest possible route to their next shot and therefore tactics have to be adopted to ensure alternative paths are taken..."
using the higher features and margins in winter has a dramatic effect on spreading wear, not only over the whole putting surface but also influencing entrance and exit routes.

Where space allows, the provision of alternative tees off line and in front of existing areas has distinct advantages, proving invaluable for resting and renovating the well worn summer routes from green to tee and tee to fairway. In a similar way, skillful siting of winter tees with the obvious pathway re-turfed, a simple roped detour offers no great hardship can bring alternative fairway landing zones into play.

Where space for alternative teeing ground is not available, look to be extending and re-leveling existing tees which will help to spread wear by providing extra area and, when associated with an increase in width, allow for additional lateral movement of tee markers. Where a path is mown out from the tee through the carry to the fairway, it is good policy to change the line during the winter months and thereby, altermate traffic flow.

With increasing levels of play during the winter period and little frost and snow over the last three years, there is an increasing chance of a significant degree of damage occurring through the autumn to spring period. With limited grass growth recovery capacity due to the weather and ground conditions and the curtailing of routing maintenance work, it is important that winter play is strictly controlled, especially on the greens. During adverse weather conditions, primarily frost, there can be a requirement for temporary greens, even taking into account the aim of playing on the putting surfaces for as long as possible throughout the year. However, temporary greens are never popular with members, but if golfers accept that as winter golf is normally less competitive and there is only slight inconvenience caused when playing to temporary greens of a satisfactory standard, then putting surfaces on the main greens can be preserved for the competition season, when they are expected to be at their best. The key to winning over golfers is to prepare separate, good quality, temporary greens (say 100-200 square metres) well in advance and some distance away from the main putting surfaces.

... but don't just take our word for it, ask any one of TORO's customers since the early 70's and we have every confidence that they will confirm there's no other turf management machinery to compete with TORO quality and real value for money!

Every course and its greens have their own special characteristics. The TORO Greensmaster 3000D enjoys the challenge and by providing fully floating cutting units, a uniform quality of cut is assured whatever the conditions.
This another course of action which be instrumental in changing the pattern of wear.

One bone of contention that comes up every winter is the question of trolley use. The change from narrow to wide-wheel trolleys did help to relieve the extent of turf damage to a degree, although with the increase in volume of traffic and the proliferation of heavier, powered trolleys, the problems of wear are now increasing again, notably under wet surface conditions in the late autumn and through the winter months. The main drawback to trolleys is that they are usually confined to the same traffic routes. Re-routing can overcome some of the difficulty, yet golfers should be encouraged to carry their clubs during the winter months. Using a reduced number of clubs in a 'pencil' golf bag without the attendant suitcase of accessories that the larger bag affords should be practicable for the vast majority of golfers without significantly diminishing the enjoyment of the game. By this means, members and visitors will be able to circumvent obstacles with less difficulty and traverse the putting surfaces and adopt a much wider range of traffic routes. Indeed, a ban on trolleys would prove most effective through the winter months, say December to March, when the surfaces are most vulnerable.

Extremes in weather patterns, mild winters and increased levels of play as well as the introduction of heavier trolleys have all contributed to the increase of traffic on the vast majority of golf courses. This has led to worn turf surfaces and compacted soils and so it is vital that all head greenkeepers adopt an ongoing policy of spreading wear and maintaining good soil conditions and grass composition. Preventative aspects are also very important, eg, initial design. Establishing cooperation and channels of communication between committees, golfers and green staff is also vital, so that the objectives behind decisions taken and work completed are appreciated by the general membership and hence, increase the chances of co-operation. This aspect will be particularly important in the immediate future as the implication of increased usage is greater wear and tear.
