The two courses of The Berkshire were built on 460 acres of open heathland in 1928, the architectural creation of W H Fowler, Harry Colt and Tom Simpson. Since that time there have been few alterations save those made by nature, which has shown as an abundance of trees lining the fairways and surrounding the majority of tees and greens. These are mostly Pine, Silver Birch and Sweet Chestnut, 90% of which are nature's own planting.

These may make the courses look attractive but bring problems such as loss of heather, lack of air-flow around greens and tees and the creation of shade. In addition there are many roots which have encroached upon the course.

In this part of the county the season for visiting parties begins in March and lasts until mid November. We are still mowing greens three times a week in November and cut greens, tees and surrounds weekly until January.

Air-flow restriction around greens means that with mild weather we suffer from fusarium patch. This makes me very unhappy, especially when this is shown as an abundance of trees lining the fairways and surrounding the majority of tees and greens. These are mostly Pine, Silver Birch and Sweet Chestnut, 90% of which are nature's own planting.
