Great praise for Honorary Award

My reason for writing to you is two fold. Firstly, I would like to congratulate Mr Jim Arthur on his award of Honorary Membership of BIGGA. For some of us the name of Mr Jim Arthur is British and international golf greenkeeping and as such this is a most fitting award. Secondly, I would like to thank the association for giving this award.

During my time in greenkeeping I have noted on many occasions that either verbally in discussions with or when I have read interviews with some of our most respected Course Managers, they would be very strong in their praise and respect for Mr Arthur. This respect I believe comes from their many years working with Mr Arthur and watching their courses improve under his guidance.

We, as an industry, are very fortunate and owe a huge debt to Mr Arthur for writing his book for all of us to study and benefit from. Now in their praise and respect for Mr Arthur, I shall start either verbally in discussions with or have noted on many occasions that the association for giving this award.

Arthur is British and international for writing his book for all of us. This respect I believe comes golf greenkeeping and as such this is a most fitting award.

For these changes to become mainstream, we have to embrace a wider environmental educational programme not just for greenkeepers, but for the golf watching public. The media are quick to show the negative side of golfcourses, maybe this can now be turned around and golf seen in its true light.

New Canadian friend offers BTME thanks

I can’t express my thanks for the hospitality that was extended to Dean Filler and myself at BTME 2000 in Harrogate. It was truly an unforgettable experience. The Conference itself was educational and professionally managed in its entirety. The BIGGA Staff could not have been more accommodating, and the genuine friendliness of all the BIGGA members, both Superintendents and industry personnel, was overwhelming.

The invitations to all your social activities really made me feel like an honoured guest. The wind up banquet could not have been more fun (what a party). When I returned home I could not believe the collection of business cards that I had from many European countries. Truly your conference is an international event. I will tell everyone to find a way to make the trip to participate in future BTME’s. The value this experience gave me will help guide me through the next three years of service with the CGSA.

I look forward to seeing the many new friends I made and please extend my thanks to the rest of the BIGGA staff for looking after me. In closing, I would just like to say how optimistic I got to the challenges that face our associations and its members when we discuss things together and the direct result of the trip for me is that the world has become a much smaller and friendlier place.

Simon Coles, Greenkeeper, The Kendleshire Bristol

Environmental: Not eco-warriors

With regards to the Environmental Summit at Valderrama and the world attention in general on green issues, I believe we, the golf industry, are at the centre of what is a very important and emotive subject.

It is generally accepted that controls over chemical usage are being tightened and will continue to be so, therefore one must accept a need to use other means. An environmental approach is an avenue that may serve all parties; by encouraging wildlife which in turn can be incorporated into an integrated pest management programme and so be seen to be doing the right thing.

However, management of this style does come at a cost, and with budgets becoming ever tighter, environmental issues seem to be placed well down the list of priorities. The general planning and carrying out of such actions are left to enthusiastic individuals who use their own time and efforts to achieve results. This situation must change for us to go forward.

For these changes to become mainstream, we have to embrace a wider environmental educational programme not just for greenkeepers, but for the golf watching public. The media are quick to show the negative side of golfcourses, maybe this can now be turned around and golf seen in its true light.

We can, and should, embrace a more environmental approach and not think of it as long hated hippie types, in open-toed sandals, waving peace banners, but as a sound practical tool that can be used to great effect. Whether we like it or not, things are changing environmentally and we have to adapt to the challenge.

There are many programmes on TV about wildlife, but how many feature golf course? Perhaps the powers that be would like to redress the balance.

Well who knows?

Jay Leach, Secretary/Treasurer, Canadian Golf Superintendents Association

Icy solution to winter greens damage

I have just glanced through this month’s edition of Greenkeeper International and saw Peter Broadbent’s letter regarding spike damage. I wrote to him direct and immediately realised what was causing them. By this time however it was past nine o’clock and a large number of golfers had already gone out. To suspend play now would be pointless and non of rapid (sometimes within 2 or 3 steps) build up of slushy frost and damage, which is manifested as blackening.

Damage.

I noticed the build up of ice on my shoe studs and I had to tap my shoes regularly to remove it. On reaching the green I was horrified to notice large stud sized holes and notice large stud sized holes and immediately realised what was causing them. By this time however it was past nine o’clock and a large number of golfers had already gone out. To suspend play now would be pointless at. 1. The damage had already been done. 2. It would mean contacting all the golfers on the course and asking them to stop play. 3. I could imagine the outcry, as most golfers resent any interruption to their game and rarely understand the reasons you give for such a request. 4. As the phenomena would only be short lived, it would be a lot of effort for very little gain.

I also noticed that it only seemed to happen when the frost was not severe - the temperature was hovering at, or just below, freezing point. This could be because of (see note) water’s unique property of expanding (or becoming less dense) between 4 and 0 degrees centigrade. Therefore it has far more bulk than would otherwise be the case and builds up rapidly on golfers’ shoes. As you mention it forms a lump of soft ice on each stud, and, unless golfers remove all traces of it, before walking on the golf green, it can, as you say, cause severe damage.

It is worth noting that the slush can still form on studs whilst on the green. In my experience it seemed to form readily on metal studs and I can not think of a reason for it to form more readily on plastic studs. Unless of course it is linked to the fact that plastic is not as good a conductor of heat as metal. This could mean that the warmer plastic initially adds to the thawing of the frost.

P.N. Bettenshaw

(*Note) As far as I know, water is the only liquid that has such properties. All other liquids become denser unless subjected to high pressure, i.e.25 atmospheres.
