SAFE POURING

Whether you manage a golf club, sports complex, football stadium, playing fields, private estate, market garden, orchard, horticultural facility or small arable farm the problems are going to be the same if you handle chemical concentrates in small packs.

You have to pour into a measuring jug before adding the concentrate into the sprayer. Then you have to triple rinse the jug to ensure it is clean. And worst of all you are required to do it with an impervious full length suit, gauntlets, boots, mask, helmet and face shield, even in hot weather! If you don't, you are taking a risk with your long term health and putting your employer at risk.

Chemlok frees you.

You can discard your measuring jug – and the chemical suit too, because using Chemlok does not require protective clothing.

The flow controllable valve allows you to measure precisely in 25ml increments and a built in spirit level lets you know that the gauge is plumb.

Full transfers can be completed at the rate of half a litre in eight seconds. The chemical is mixed into the filling stream.

The integral power rinse facility, using clean water from a tap or irrigation system, thoroughly cleans containers, removing more than 99.99% of the product, so that empty containers are safe for disposal and there is no wastage.

Chemlok will handle:

• Any liquid formulation from any manufacturer in any container from 1 – 1000 litres.
• Containers of 1 – 10 litres are processed through the valve.
• For larger drums and IBCs, use the optional drum extraction.
• Standard thread size across the Northern Hemisphere is 63mm, but we also have 45mm and 60mm adaptors and can make other screw-in thread adaptors if required.

NEW RANGE OF VACUUM SWEEPERS

Trilo has introduced the new SG800 into the range of quality vacuum sweepers.

The SG800 has the ability to collect leaves and litter using the two metre suction hood and brushes or use the big cab controlled hose. Uniquely the hose can be used on either side of the machine, giving greater flexibility for the operator. The material passes through the armoured fan and housing into the seven cubic metre hopper, being chopped and mulched on the way through.

LIGHT ON YOUR FEET

Spring 2004 marks the launch of a revolutionary new footwear build concept from Hi-Tec. The new V-Lite system will guarantee Hi-Tec strides into the New Year delivering the most impressive collection of ultra-light golf footwear available.

The lightness achieved from the Hi-Tec V-Lite collection cannot be credited to one single technology or material but a breakthrough philosophy based on new and refreshing design insights with a creative and inventive combination of innovative materials and build construction. The result is exceptional – the most lightweight collection of footwear on the market, without any compromise on style, comfort or performance.

All shoes in the V-Lite new collection weigh in at less than 400g and include standard features such as:

• Dual Density phylon V-Lite Sole providing an ultra lightweight unit that offers unbelievable levels of cushioning, support and traction with the added weight.
• Ultra Performance lasting board for maximum strength and flexibility without compromising lightweight and comfort.
• Technically advanced linings with comfort, breathability and moisture wicking properties.

A GREAT IDEA

A Wentworth member has developed a tool which repairs divots quickly and easily and the idea has been taken on by BMS.

Roy Harrison, a Wentworth member of 30 years standing, retired eight years ago and with spare time on his hands looked to see if he could invent something useful to the game of golf.

"At first I couldn't think of anything until one day I was playing golf and it came to me when I saw the terrible damage that golfers do to the teeing areas of par-3s. The divot holes are filled with a mixture of sand, soil and seed which is not very satisfactory and it takes a long time for the damage to repair, if at all," explained Roy.

"I had a chat with one of the greenkeepers and asked him if any company had come up with a tool that could repair the damage instantly and he said that there had been some devices which had come and gone as they hadn't achieved their aim.

"I then decided that I would see if I could design a tool that would do the job successfully."

Roy made a study of divots over the next few months on fairways and was surprised to note that hardly any of them regrew. They were either pulled out by birds or mowers or stamped on so hard that they died in their hole.

"I decided to use my lawn as a testing area for replacing divots and see what would make them grow successfully. I had the idea that it was the lack of aeration that was causing the hard tamped divots to die so I stamped a divot into my lawn and punched holes all over the whole area and sure enough the divot grew really well.

"I knew what was needed - a tool that would stamp in the divot and at the same time aerate it."

After a few prototypes Roy came up with a tool which solved the problems he'd encountered.

"The tool is made up of 45 steel pins ground to sharp points set into a steel box five inches by three inches with a steel handle. A steel plate with 45 holes drilled into it with springs on each corner allows the divot to be stamped in and at the same time to be aerated with the 45 pins."

"I have tested this device over a long period of time and found it useful for other jobs such as preparing bare ground for seeding, aerating areas which have been well compacted and tamping in new turf without compressing the roots."

Roy contacted BIGGA to ask for advice in manufacturing and developing the tool and then contacted James Buckholt, of BMS, Luton. Who after seeing the tool in action, agreed to produce and promote it.
