The reduction in fungicides - a new dawn or a nail in the coffin for commercially viable golf?

Having just returned from the South Coast seminar I feel very positively stimulated about the health of our profession when it can produce such high level debate to a full house. The dissertation from Ian Tomlinson about how he had converted Poa greens to fescue/bent greens after the ban on fungicides in Denmark, where he works, was inspiring and he must be congratulated on such an excellent piece of work, which he is willing to share with all.

His recipe for getting back to sustainable greens is creating much interest from the R&A, who have published their first of two articles on this in this magazine. For all Course Managers who have concerns about having Poa dominated greens with future restrictions on fungicides looming, it is well worth the read. His pictures of a Danish golf course with 100% fescue on all areas were extremely thought provoking.

The one is based on single minded, autocratic leaders of the commercial world there are two ways our industry can go. It seems to me that in this ever more increasingly fraught time we must be congratulated on such an excellent piece of work, which he is willing to share with all.
