So here we are again. Water companies have put in place water use restrictions that include watering a “garden” using a hosepipe. The “garden” in question includes, amongst others “an area of grass used for sports or recreation,” and the hosepipe appears to cover a plethora of irrigation equipment that can include static and pop-up sprinklers.

If your course is irrigated using water from the potable supply and is fed into a storage tank you cannot water from the potable supply and static and pop-up irrigation systems on golf courses in the UK goes back to the late 1960’s and for many years the turfgrass irrigation industry worked hard to raise design and installation standards by offering training courses focusing on new system provision.

This was extremely successful and many of the industry’s key personnel benefited from the training. Since that time automatic irrigation has become considered an essential management tool by Course Managers. So is enough being done today to provide greenkeepers with the knowledge they need to use their systems to the optimum?

There are still some excellent courses being run by respected industry figures to secure the quantities of water required to maintain the course. Perhaps we need to look at how we can demonstrate our water use efficiencies will bring public relations benefits. It will also be important when discussing or negotiating with water providers whilst attempting to secure the quantities of water required to maintain the course.
