Around the Green

at Perranporth for making our day run so smoothly. Also thanks go to the Head Greenkeeper Bill Mitchell and his Assistants John and Fred who always have their links in magnificent condition.

Richard Whyman

South Wales

Well spring is truly upon us and I'm sure that you're all busy lowering your verti draining and the like. Let's hope for a warm wet season and no prolonged dry spells.

Our latest Pencoed College evening lecture failed to take place due to the untimely withdrawal of the lecturer to be! To the rescue came our Education Chairman and Timekeeper, Malcolm Davies with his Assistant and Quizmaster, Peter Gillard. A quiz to beat all quizzes was arranged the evening and doing such a grand job.

South West

February saw about 30 greenkeepers turn out for the Lawson Trophy at Clevedon GC. This was quite encouraging considering the forecast which was nothing short of horrific.

However Mr Fish and Mr Keely etc were a bit wide of the mark and we got away with some light winds and a bit of scotch mist just to keep us on our toes.

Clevedon is in the throes of some major rebuilding work at the moment and so we were on a bit of a cross country race trying to find the 18 holes in the correct order but the new greens, particularly those that had recently been built by the greenstaff themselves were in quite exceptional condition.

Almost perfect fescue dominated swards are difficult to find during the best of times but in the middle of February, well I can only conclude that Barry Reeves and his crew must have a magic wand or something. Anyhow, enough of my petty envy, thanks are due for all their hard work and obvious expertise.

Having got back to the clubhouse safely we were then given an excellent late lunch followed by the sharing of the spoils, all of which were presented by Lawsons. First place with 36 points was Michael Fawcett of Malborough with Maurice Pierce of Wells in second with 34 points on a countback from our beloved Secretary Peter Baynton. A sterling performance considering the pressure he is under. Thanks to Lawsons for their sponsorship and to Clevedon Golf Club for allowing us the pleasure of their course for the day.

Remember the short courses. We have recently held a First Aid course and a PA1 and PA6 all of which appear to have been successful. If there are any others you would like to go on please give me a ring on 01380 828380.

Marc Haring
Does your current supplier of Top Dressings, Root Zones and Sands:

- Own a quarry containing the highest quality Cheshire Silica Sand?
- Produce all products to BS EN ISO 9002?
- Carry out hourly tests of all of the grades of sand which they produce, to ensure the highest quality?
- Test every batch of Top dressing and Root Zone to assure you the consistency which you require?
- Have the productive capacity to produce 600 tons of Top Dressing per day, so that you will not be let down at the busiest times of the year?
- Use top quality hauliers to ensure that deliveries are in the right place, at the right time and without a mess?

If your current supplier cannot offer you all of these, we would be delighted to.

Please call 01270 765996 for prompt service and delivery.

Two integral cogs in the workings of golf

by Bob Taylor, Ecologist STRI

What an excellent show BTME turned out to be. All of the seminars I was involved with were extremely well attended, the practical workshops were filled to capacity and the show itself surely must have encouraged record levels of entrants. The STRI stand was certainly full to bursting most of the time, with a considerable amount of discussion being devoted to ecological aspects of golf course development and management.

It could, I suppose, be argued that greenkeepers were being polite realising my interest in discussing their course and what has been achieved, but I did on several occasions throughout the early part of the week during dinner, etc. overhear people discussing ecological issues such as how many trees have been planted and how raising the cutting height on areas of grassland has improved the course. Comments including, "Members didn't like it much at first" and "I was nearly hung for chopping that tree down" were also overheard. Greenkeepers did appear, and I am sure they are, genuinely interested. Indeed, I have always said that to the greenstaff, managing 'through the green' is a hobby, an interesting extension of their workload and a break from some of the more tedious operations one could mention.

It was also interesting to note how most of the seminars during the week came round at some point to the need for sensible rough management.

Larry Gilhuly (USGA) showed the results of a members' questionnaire, and the environment came high on the list of their expectations of what constitutes a good course.

Bunkers were a major talking point. Why do we need so many? Answer, we don't - we could achieve far more from a sensible approach to using the grasslands, e.g. semi rough, grassy hollows, the heather, water features, ditches, ponds, etc., if club committees and members should be brought around to this way of thinking. Education therefore will over the next few years be essential in this area and must be an important step in the way forward.

Talking of the way forward, I discussed at length the importance of the environmental management plan as a baseline for management. The plan will identify what can be found and how it will change given different management regime. It will form a baseline for monitoring, assessing gains and interest. Indeed, it is only by this approach that the wider environmental bodies, the general population (public), etc.
will appreciate that golf is not a selfish use of the land, nor is it a pesticide dump and reservoir of toxic waste, as reported in certain press.

So, where do we start?

THE FIRST STEP
Setting up a Management Plan

The first step will involve an initial assessment of the course to classify the vegetation types. The plan must use the data collected to formulate an overall goal, determine the most appropriate targets and management techniques, directing the management in this way will help to ensure that any money spent is used to the best effect, to ensure the most efficient use of the land and the resources to improve the course for play and for wildlife. Any target must be realistic, "ambitious" possibly and quantitative in terms of habitat and species quality and extent. A major aim must be to recognise the need to hall naturally occurring deteriorating referred to by ecologists as "succession" (eg. scrub invasion) and to retain habitat quality alongside the management of the playing surfaces.

A thorough site investigation will be a prerequisite towards the production of a long term management plan. The management strategy for the course must be practical and sustainable as the programme, more than likely, will be carried out by the greenstaff during appropriate periods using hired or club labour and machinery. If the management tasks being proposed are not practical or indeed affordable, then the project is unlikely to be sustained into the longer term.

The initial assessment of the course should be undertaken by a qualified ecologist with relevant field experience in applied ecological management and indeed the workings of the golf course. The Head Greenkeeper should be present for at least part of the assessment period so as to gain knowledge and reasoning behind the types of work being recommended.

The inspection of the course with all interested parties should provide a full description of the site and detail areas of importance while outlining and reiterating the main focus of the study.

The study should: (a) describe the site through collation of available physical and biological information; (b) identify objectives and purpose of course management; (c) realise conflicts and achieve the best means of resolving them; (d) detailed management strategies to achieve objectives; (e) identify and detail scope for monitoring (auditing).

The above objectives form part of the N/SVQ Greenkeeper Training Certification (Level 3) under the mandatory additional tasks within the Supervisory Section. These include: (a) Monitor and survey (b) Collect and record data (c) Analyse, evaluate, interpret and report.

Monitoring thereafter is an essential component of any management planning.

‘Timing of the works will be essential if wildlife losses are to be avoided – it is of no benefit to clear a pond during the height of the breeding season’

It will be necessary to detail and demonstrate the degree and effectiveness of the management programme and the likely timescales involved. It may be that the work fits into a phased timetable utilising periods within the year that tie in with the greensstaff’s annual works programme. Equally, timing of the works will be essential if wildlife losses are to be avoided – it is of no benefit to clear a pond during the height of the breeding season, far better to implement the work when this is over but before the onset of the colder winter period. Phasing the work, ie splitting the water feature arbitrarily into portions, and carrying this out through just one portion each year will allow wildlife the chance to move safely as the work progresses. Undertaking the work in this way will ensure that habitat and species continuity and sustainability are maintained and encouraged.

The concept of sustainable development is an integral component of ecological management. There is little point in encouraging wildlife by initiating ecological/course improvements if the management regime necessary to sustain it cannot be maintained year after year.

The management objectives, if they are to survive long term, must reflect club policies and must be compatible with them. A further aim of the assessment should be to help club communication, ie between club officials and members and outside, to improve the course image within the wider population. Drawings and details of conservation work posted within the clubhouse and around the course on notice boards together with periodic informative evening discussions will all help to raise members’ awareness of conservation management and may help to protect one or two areas from excessive trampling damage (heather-dominated carries, for example, are particularly sensitive).

The above will give an evaluation of the golf course which can then be monitored, enabling subsequent changes to be made to "fine tune" the management programme as and when required. It will help give priority to some tasks over others but, most importantly, will offer in a practical way a long term management strategy for the course that is readily achievable and affordable, both in terms of the greenkeeper’s time and the financial budgets of the club.

A management plan can all too easily become heavy with detail and format, and it is essential, if the end user (the greensstaff) is not to be put off or lack confidence in deciphering it, that the plan compartmentalises the detail away from the important management prescriptions. In management programmes we have to think long term and to define what will be required over perhaps five to ten years. We also have to quantify what is likely to be needed in terms of the four Ms: Men, Materials, Machinery and Money.
Goodbye weeds.

Goodbye empties.

‘Intrepid’ will take care of your turf weeds

‘Intrepid’ is a new cost-effective selective weedkiller that can be applied throughout the growing season. It’s powerful three-way mixture will control many broad-leaved weeds in turf. And unlike some turf herbicides, repeat applications are possible should new weeds germinate or deep-rooted weeds regrow during the season.

Miracle will take care of your used containers

Empty pesticide containers are no longer a problem. In conjunction with a registered waste disposal contractor, Miracle Professional offer a free service on the UK mainland for all Miracle (ICI/Zeneca Professional Products) labelled containers. Envirogreen Ltd will collect and dispose of your empties in full compliance with legal requirements.

Good buy, **Intrepid**

Miracle Professional
Salisbury House, Weyside Park, Catteshall Lane, Godalming, Surrey GU7 1XE. Tel: (0990) 301010
Part of Miracle Garden Care Ltd.

‘Intrepid’ contains dicamba, dichlorprop and MCPA. ‘Intrepid’ is a trade mark of Miracle Garden Care Ltd.
READ THE LABEL BEFORE YOU BUY: USE PESTICIDES SAFELY.
Clear Leaders on the Fairway.

Ransomes®
Fairway Mowers.

Today's fairways demand a level of quality that was formally reserved for golf greens. To meet these higher standards of presentation course managers have a superb choice in Ransomes "right weight" fairway mowers. There's the 5-unit Fairway 250 and 305 and now the 7-unit Fairway 405 which offers genuine extra productivity with a big 4 metre cut. If you need even more power the Ransomes Commander 3500 high output 5-unit machine offers the ultimate choice in fairway mowing. Ask for a no-obligation demonstration and see the difference Ransomes can make to your fairways in quality of cut, manoeuvrability and productivity.

Call 0500 026208 for details.

RANSOMES is an Official Supplier to the PGA European Tour.
The objectives of management therefore must be clearly defined at the outset. Thoughtful planning and consideration must be given to the requirements of individual species present within a given habitat type and to the requirements of animal or plant communities whose interactions are fundamental to the successful workings of the habitat. A major objective must therefore be to maintain or improve conditions within the vegetation types for communities, forestalling further losses or possibly extinctions. For example, where there are populations of red squirrel, it is important not to affect the balance of tree species which could render the site more attractive to grey squirrels. The native red squirrel is now such a rare animal that if any golf course has a population, it would be highly advisable to take whatever steps are required to ensure that this attractive and popular rodent is encouraged. This may be encouraging a greater diversity of conifers to maintain a more constant food source (red squirrels eat conifer seeds) while retaining low numbers of deciduous trees. This indeed may be the converse of what may be generally thought the most appropriate form of management!

Each habitat found on the course would be represented in the management plan. It will be necessary to highlight the importance of tree removal alongside tree replacement, or infrequent grassland management within areas of deep rough. Management within and around water features may involve infrequent desilting, vegetation clearance and maintenance of water quality. On heathland sites, heather management will be of major importance, together with the removal of scrub and naturally regenerating tree species.

Monitor and review
Monitoring is an essential component of management planning. The management plan should encompass periodic ecological audits of the course to assess the degree of conformity and the extent to which the desired objectives set up for the individual areas are being achieved. The period for repeated auditing will vary to some extent according to the sensitivity of the site. Although an initial review should ideally be undertaken within the first three years, varying thereafter, repeated monitoring will be of considerable importance in areas supporting potentially invasive plant species, such as bracken, birch, rhododendron, Japanese knotweed or Himalayan balsam.

Site, species or habitat monitoring should be followed with a "review" of the management plan. Following changes on site, it may be necessary to update or modify the management plan. One of the main benefits derived from the monitoring and review process is the possibility of being able to improve upon the management techniques being used as knowledge of the most appropriate methods continues to develop and improve.

Given the interest that is now apparent through the golf industry towards ecological and environmental issues, it may be worth stating that BIGGA have been instrumental in the production of a practical guide to ecological management and accompanying video showing management techniques in action. Both are available from Aldwark Manor. STRI Golf Ecology Services are available through Bob Taylor, Ecologist with STRI who can be contacted on 01274 565131.

Manufacturers of top quality Fine Plant Food. Supplied to Scotland's leading Golf Courses & Sports grounds. Congratulations to Souter of Stirling on their 30th Birthday. Many Happy Returns.

We are pleased to supply Souter of Stirling with our professional range of amenity grass mixtures. Congratulations on 30 years in business.

Congratulations to Souter of Stirling on reaching their 30th anniversary in the Sportsturf Industry. HMC are delighted to be associated with them and wish them continued success.

As a celebration of our 30th anniversary in the sportsturf industry, we wish to take this opportunity to thank all our customers over the past 30 years. Your valued custom and support has enabled Souter of Stirling to develop the level of service and professionalism expected by our industry. Customer satisfaction has been the backbone of Souter of Stirling's development and we trust that this customer satisfaction will enable Souter of Stirling to continue supporting our customers over the next 30 years.

To be effective, pumps must deliver an adequate flow and pressure, and handle the desired chemical without rapid corrosion or wear.

Sprayer pumps generally fall into four types: 1. Roller Vane. 2. Diaphragm. 3. Centrifugal. 4. Piston.

The two most common pumps found in turf and landscape sprayers are roller vane pumps and diaphragm pumps. However, sprayers supplied with Piston and Centrifugal pumps are available.

Roller vane pumps produce moderate flows and pressures. The rollers are held in a slotted rotor revolving in a concentric care. As the rollers pass the pump inlet, the cavities between and under the rollers enlarge and draw in liquid. When nearing the outlet, the cavities contract - due to the concentric housing - and force the liquid out of the pump.

Roller vane pumps handle a variety of pesticides and have a low purchase and maintenance cost. These pumps operate very efficiently, but as pressure increases, the volume (output) decreases.

For courses that use wettable powders regularly, a roller vane pump should not be selected as it is unsuitable for use with abrasive/corrosive materials i.e. iron and nitrates that rapidly cause wear to the pump housing, the slots in the rotor and the rollers. Though replacing the rollers is quite simple it may not restore the pump to a satisfactory working condition.

Diaphragm pumps have at least one chamber sealed at one end by a membrane or diaphragm. The other end has an inlet and outlet valve. The diaphragm connects to a piston. As the piston moves, suction draws the liquid through the inlet valve by moving the diaphragm, which enlarges the chamber. The return of the piston forces the diaphragm forwards shrinking the chamber and propelling the liquid out.

Diaphragm pumps require little maintenance because there is minimal contact between the spray material and moving parts. Abrasive materials are less likely to damage this type of pump, however the diaphragm will require periodic checks every two - three years for leaks. Most pumps have a diaphragm that is resistant to commonly used chemicals and provides a long service compared to other types of pump.

Piston pumps propel liquid by a piston moving in a cylinder and operate in a similar way to Diaphragm pumps but, due to the materials coming into contact with the cylinder bore, they are more susceptible to wear and damage. The intake stroke draws the liquid in through one valve and the output stroke forces the liquid out through another. Piston pumps require either an internal or external air chamber (surface tanks to dampen pulsation in the liquid flow associated with each pump stroke. Without the gurge tank, the sprayer will "pulsate" rather than spray a steady stream.
Experience 'J' savings and make your course a 'C' above the rest

To celebrate 21 years in the industry
Bailey’s of Norfolk announce the introduction of the “Greenkeeper’s Charter”

The “Charter” is a commitment to supply Turfdressings, Root Zones, Divot and Tee Dressings that are of the highest quality. Our own “in-house” Soil Analysis Laboratory, allows us to ensure that:

- Every load you receive is accompanied by an up-to-date laboratory analysis
- The pH value is clearly stated
- The dressings particle size fall within the parameters recommended by the USGA
- The quality and consistency of dressings supplied is continually monitored
- The raw materials used are continually analysed for suitability
- Provision of a FREE on-site sampling and analysis of your greens
- We can provide a FREE analysis of your current dressings
- You receive technical and informational back-up
- 21 years of experience in the top soil business, is used to support Greenkeepers.

Bailey’s of Norfolk
Turf Dressings that meet the highest specification and a commitment to support Greenkeepers.

Brick Kiln Road, Hevingham, Norwich, Norfolk NR10 5NL
Tel: 01603-754607

Experience *Relief* savings and make your course a *Cut* above the rest

SATISFACTORY CUSTOMERS:

“Every forward thinking Golf Club should have a June in their workshop, a truly excellent machine”, Mr. Mark Jones, Head Greenkeeper, Preston Golf Club.

"Hunter’s relief grinding is far superior to anything I have ever seen, each blade cuts true, the savings are substantial and the cost is minimal!”, Mr. Roger Shaw, Course Manager, Ramside Hall Golf & Country Club, County Durham.

“Our sole plate/bottom blades are now lasting between 2-3 times longer than when we were spin grinding”, Mr. Philip Baldock, Head Greenkeeper, Royal West Norfolk Golf Club.

“It is the best piece of machinery this course has ever invested in, a fine machine that I would recommend to anyone”, Mr. John Bashford, Head Greenkeeper of the Green Hotel Golf Course, The Kinross Estate.

“A quality machine that gives a superb finish to our cylinders, and saves money”, Mr. Derek Green, Head Greenkeeper of Royal Liverpool Golf Club.

June 36°. Will accommodate every make and type of professional cutting cylinder and bedknife. Can ‘in-situ’ grind many greensmower reels.

Water cooled (eliminates dust and heat)
simple and fast

CUT SERVICE COSTS!
Both machines will grind both cylinder and bottom blade! Both will accurately “Relief” angle grind!

IMPROVE CUTTING STANDARDS!
Both have water coolant — NO HEAT, NO DUST!
Both guaranteed to grind cylinders totally parallel!

REDUCE WASTED DOWNTIME!

Full training course with all machines

GREENKEEPER INTERNATIONAL April 1997 49
A completely new fuel storage system has been launched into the UK and European market place. This patented system is known as “Convault” – an above ground storage tank (AST) which can store petroleum based products and other hazardous substances in an inherently safe and environmentally sound format. An above ground fuel tank is pictured above.

Although new to markets on this side of the Atlantic, Convault has been in service in the U.S.A. and Canada for approximately 10 years with over 17,000 tanks sold to date.

Convault has been developed to meet the highest environmental and fire safety concerns. Within the UK, Breton Precast Ltd. recognised the importance and potential contribution of the regulatory authorities. From this a Risk Assessment Document was compiled which addressed the key safety and operational issues. This document received a positive response from the regulatory bodies involved.

The environmental benefits of using an above ground system includes full visual inspection of the tank at all times which means, should a leak occur, it is detected at the earliest opportunity, removing the possibility for soil and ground water contamination which is associated with conventional underground storage tanks and below ground suction lines.

Convault’s complete above ground vaulted tank and fuelling system is constructed using a steel tank which is insulated and wrapped in a poly membrane liner, all of which is then encased in a 150 mm reinforced concrete shell. The complete unit provides full primary and secondary containment, a certified fire wall, can withstand vehicle incursions and it is also bullet resistant.

Convault meets applicable safety requirements for secondary containment, leak monitoring, spill and over spill protection, and is also certified for phase 1 & 2 vapour recovery.

The initial size of the tanks available range from 4,500 litres (1,000 gal) to 18,000 litres (4,000 gal). For further information telephone 01234 351711.

Spaldings latest addition into their 13,000 strong product range is a professional quality 16 litre knapsack sprayer. The sprayer, say Spaldings, is designed for long periods of use in arduous conditions. It combines an ergonomic tank design with balanced weight distribution for accurate and efficient application of today’s pesticides.

It features a heavy duty 1000cc piston pump for a long trouble free life and an easy move handle allowing for to right handed operation and is designed to suit all users.

The telescopic lance, say Spaldings, is supplied as standard with an adjustable nozzle to suite all application flow rates. The machine costs £59.98. For further information telephone 01522 500600.

Rolawn, Europe’s largest turf grower has introduced the ‘Turf Inspector’. The character will be used to convey the company’s message about the independent testing of its turf by the Sports Turf Research Institute.

“We want to make some serious points about turf quality and we feel that the turf inspector helps us to do this,” stated Terry Ryan, Rolawn’s Sales & Marketing Director.

Turf Testing Director Andy Newell of the Sports Turf Research Institute visited the Rolawn Turf Company’s fields recently to conduct tests on the botanical composition of Rolawn’s well known Medallion turf.

The tests which took place late last year on two fields amounting to 92 acres, revealed an annual one percent and identified exactly the cultivated grass species present in the finished turf.

The tests were carried out to STRIs own operating procedures and not to a procedure set out by the Company. Rolawn began its policy of inviting independent testing by the STRI in 1995. The first tests were conducted to identify the botanical composition of their Advantage greens turf.

The company is happy to provide free copies of the STRI reports upon application.

Concern over the increasing number of thefts of grounds maintenance equipment has prompted Buckinghamshire-based Risboro Turf to become the first manufacturer to fit Datatag as standard on all pedestrian self-propelled and riding machines produced by them including, the new Little John scarifier and Big Willy aerator.

Commenting on this security initiative, Director, Richard Taylor said, “During the year, the British Agricultural and Garden Machinery Association set up a scheme to fight garden machinery theft. Through this we learnt about Datatag, and realised it would be an invaluable addition to our products We are fitting them during production at no extra cost to our customers.”

Datatag is an electronic identification device that utilises micro-transponder technology. Each tag has its own 10 character alpha-numeric code which can...
