Hayter gang mowers
for greater reliability, output and versatility

The evolution of the classic Hayter Trained Gang Mowers continues with a host of new features:

- Electro hydraulic lift control option
- Improved shock absorber systems
- Independent operation of outer cutting units
- Fully interchangeable cutterheads
- Built in Britain by British craftsmen.

Hayter gang mowers — the finest long term investment you can make.
"Haven't the time to search for that specific second hand fine turf machine you require, then try us now at"

Just a few examples

Turf Gators 6x4 (diesel) rear hitch, electric lift bed
from £3,900 ex VAT

Turf Gators & 4x2 Gators (petrol) rear hitch, electric lift bed
from £3,200 ex VAT

F1145 utility mowers with 72" out front rotary deck
from £8,250 ex VAT

2653A utility mowers with 30" 5 reel blades, 80% wear remaining
from £7,800 ex VAT

2653A utility mowers with 30" 8 reel blades, 80% wear remaining
from £9,900 ex VAT

1200A Bunker rakes with front blade and rear rake
from £3,400 ex VAT

"Unbeatable prices! Let the strength of the pound work for you!"

Scott MacCallum travels to England's easterly most point to meet a man who eats, drinks and breathes his golf

Slice John Beamish through the middle and the drinkers among you may be a little disappointed. Instead of finding copious quantities of the black liquid with which he shares a name you are more likely to discover the words Rookery Park Golf Club. Because John Beamish is Rookery Park through and through.

He has worked for the Lowestoft club since 1964, been Head Greenkeeper since 1984 and when the course relocated to its present site to make way for a housing development John bought one of the houses.

"I live on the 4th tee. I know that because the tree that overlooked the tee is still there," laughed John, who is very open about the place the golf club holds in his life.

"I'm married to the golf course," he says and it is not said a boast, just as a matter of fact statement.

And it is obviously a happy union because John is held in such high regard that the Club Manager, David Kelly, nominated him for last year's Toro Award for Excellence in Greenkeeping and a Highly Recommended plaque now hangs in the clubhouse lounge.

"Mr Kelly kept it quiet that he was nominating me and I only found out about it when he presented me with the forms. To tell you the truth I was apprehensive about the thought of being judged but I was really delighted.
"The team is good because of everybody in it not because of any one person"

"At the moment I don’t know whether it is a bit like the King’s clothes and we’re being sold something we can’t see... although I’m sure eventually it will be the way we’ve got to go."

John worked under four or five Head Greenkeepers before landing the top job himself.

"I applied a couple of times but, you know how it is, you’re told that you already work here so we’ve got the value of you anyway. But in 1984 I got the chance and I’ve never looked back."

John, and his team of five soon to be six, have their work cut out because as well as the 6,700 plus yard course spread out over 360 acres there is also a nine hole par-3 course.

"We have a very stable team. The last man in arrived three years ago and some have been with me for ten years. The team is good because of everybody in it, not because of any one person," said John who possesses a nice line in self deprecating humour.

"We try and keep the par-3 to the same standard as the main course but obviously the main course will always come first."

"We really are a grass factory because in the summer every part of the course has to be cut every week - and that’s without throwing fertiliser about."

John has a voracious thirst for knowledge and he is a regular attender of Harrogate - BTME 2000 was his eighth - and he will travel far to attend seminars he thinks will help him improve.

"I love Harrogate. I love the idea of it and it has helped me through my career through what I’ve learned."

"Sometimes, over breakfast, you learn more than you do in any seminar but I do sign up for all the seminars, especially the ones about health and safety. I also do a lot of reading. That’s the only way to pick up knowledge. You can’t stick your head in the sand as when the Health and Safety man comes around you might have a problem," said John.

"I’ll do anything to cover up weaknesses or better still to turn weaknesses into strengths. I often phone up the health and safety executive and ask advice. If you have a problem you are as well going to the people who make the decisions as anyone else. They can help you to develop what you’ve got rather than walk in afterwards and change everything. That’s the theory and I believe it works," said John, who speaks as a man who has two Health and Safety Officers who regularly play the course.

The golf course is a tough test, perhaps suited to the longer hitters while a decision was taken recently to reduce the height of the rough to help speed up play.

"We are also heavily involved in a bunker and fairway drainage programme. The course is built on clay and we lie for about three months of the year."
I was a bit apprehensive but it was a good day for greenkeepers and a good day for our course. In fact they want to come back again this year. I do believe if you are pleased with your course in the season you should be pleased to show it off.

John is currently trying to get away from the use of fungicides and he is looking at the biological methods. "At the moment I don't know whether it is a bit like the King's clothes and we're being sold something we can't see... although I'm sure eventually it will be the way we've got to go. As it stands you've got to commit a certain amount of money to a programme which you must stick to, whereas with fungicide you only use what you feel you need. Having said that, I do think it's the way to go and I will keep track of it."

It is a pragmatic approach borne out of experience. "Years ago I'd look at the latest machine, think it's wonderful, go for it and sometimes catch a cold so my philosophy is now to be a year to 16 months behind. I'll let others be the trail blazers." On the construction front the team is currently working on a tee replacement programme - three per year. "With so much play we need wider tees so that is what we are doing. All work is done in-house unless we need specialist skills or equipment," he explained.

Speaking with John Beamish it is easy to forget that he has 35 years in the industry as his enthusiasm and genuine love for what he is doing and where he is going, shines through.
out manoeuvres, out performs any ride-on garden tractor

These rugged mid-size machines are built for the rigors of commercial operation.
- Compact size allows mowing in tight areas.
- "Natural" control placement with front mounted deck allowing full view of mowing area.
- 36" to 52" mower decks follow contours with flexible suspension and spring counterweighting.
- 20.9hp Kubota diesel engine.
- A range of interchangeable mower decks.
- With or without Walker 'world leading' grass collection facility.

FAST, EASY, BEAUTIFUL MOWING
It is hard to imagine running a modern golf course without the internal combustion engine, yet it is less than fifty years ago since the first greensmowers were introduced and even less time for the ride-on triples. Roland Taylor investigates...

I remember a greenkeeper telling me that he started in the profession working with his three brothers for their father on a course in Scotland. Each of the sons had a push Ceres and was expected to cut six greens before he had breakfast. Anyone who has experienced pushing a multi-bladed mower will know just how hard this is, and I am sure that the introduction of power was a great relief for many. The introduction of petrol and diesel engines not only made the task easier, but saved considerable time and money. Certainly petrol engines had been on mowers since the beginning of the century, but these were often heavy cumbersome beasts so one suspects there was a reluctance to put any of them on those hallowed greens. In all probability, no manufacturer considered it a viable proposition to include a powered multi-bladed greens mower in their range. In all probability, no manufacturer considered it a viable proposition to include a powered multi-bladed greens mower in their range. Even in the 1920's, records show that in general there was very little engine-powered equipment being used on courses. The capital outlay involved may have been a major contributing factor in these cases.

One problem was the size and weight of an engine in relationship to its output. The advent of new materials such as aluminium and advancements in engine technology saw the introduction of lightweight units. These were easier to start and more reliable at punching out greater horsepower for their size. Designers of grass cutting and turf care equipment welcomed them and they were soon included in their new introductions. Diesel engines took longer to reach the stage of diminished dimensions and the ability to recover quickly when placed under load. Technology soon found the answers and the small diesel unit was born. This type of unit is now...
New for old

common place on most courses. Unfortunately storm clouds were on the horizon for engine manufacturers and users, as scientists started talking about greenhouse affects and ozone layers. Legislators took up the theme especially in the United States. It was back to the drawing board for engine manufacturers as stringent reduction levels of pollutants especially carbon monoxide (CO₂) from the combustion engine were scheduled for introduction. Whilst very little legislation on this subject has occurred here in the UK to-date, it is only a matter of time before we will see some something on the statutory books. However, the new engines we find on equipment today are compliant with USA regulations on air pollution as well as meeting noise level constraints.

The engine is such a vital component, its performance, as well as being environmentally friendly, is critical to the efficiency of any piece of equipment. For this reason it needs to be carefully monitored. A engine never lasts forever and whilst it may start well over time, wear and tear will take its toll - output levels drop, more fuel and oil is consumed and emission and noise levels increase. In addition the chances of breakdowns are escalated.

Where an engine is showing signs of deterioration or becoming problematic there are three choices available; a repair, short engine block or a new engine.

Repair
This is usually the first course of action. The fault may be easily rectified, but it may be the first symptoms of trouble ahead so it should be taken seriously and obviously the repairer should be able to advise. In the case of serious overhaul being required there are two alternatives available. If the machine is showing signs of other problems relating to drives or cutting systems this would be the time to consider a complete replacement.

Short engine (Short block)
This is available from some manufacturers and can be a less expensive way of acquiring what amounts to a new engine. The unit consists of a new cylinder block including valves, head and pistons. In fact it is taken off the assembly line before all the components such as flywheels carburettor and electrics are fitted. Not only will it have warranty cover, it will also be the latest version. The only drawback to this choice is the labour rate a service engineer will charge as this could escalate the price bringing it into the new engine category. If the work is done in-house, this could be a cost effective alternative and is certainly an avenue worth investigating.

New engine
The advantage here is that the unit should be bang up-to-date and carry a full warranty period. This replacement situation also offers another course of action and that is to fit an alternative power source i.e. diesel instead of petrol. Before going down this route the rest of the machine needs checking out to ensure all the other components are in good working order. Where a change in the make of engine is being considered then it is important to check what, if any, modifications to mountings or drives will need to be made to accommodate the new power unit. The engine supplier will be able to advise, generally there are kits available.

Whatever course of action is taken any engine needs to be regularly and well maintained. In the pressurised world we live in it is easy to forget the
little things that through neglect suddenly and unexpectedly turn into a large problem. These can often be avoided by what amounts to a quick and simple routine such as checking the oil level every time the engine is used, or cleaning dried grass and accumulated dirt from cooling areas such as fins and radiators.

Combustion pollution is very much an issue at present maintenance plays an important part in keeping emission levels low. A worn unit will burn oil whilst a badly adjusted carburettor will drastically increase the amounts of poisonous gases being pumped into the atmosphere. It will also increase the running costs, not just in the fuel and oil it consumes, but also in the time a particular job takes to be carried out. We have all had the experience of using a new piece of equipment and discovered how much easier and faster it is.

Engine technology has come a long way over the last two decades with the introduction of:

- virtually trouble-free electronic ignition
- increased output from smaller, more compact units
- reductions in fuel and oil consumption
- lower emissions and reduced noise and levels

The race is on to find alternative sources of fuel and already we have seen the use of electric power on golf course equipment. Green diesel made from natural products is also available, although there is not very much evidence of it being taken up here in the UK. On a lighter note, cooking oil is being used in diesels in the USA - the only drawback is that a trail of fumes smelling like 'french fries' is left in the vehicle's wake!

Engines are also now becoming available that have been specifically designed to run on Liquid Propane Gas or natural gas. At present these are mainly being fitted on stationary standby units such as generators, but it will not be long before there will be models suitable for mobile equipment. These should not be confused with the petrol engine Calor gas conversion kits that have been on the market for many years.

From time to time, we see in the press details of power cells and this is an area that is being explored especially by automobile manufacturers. There is plenty going on behind the scenes in the quest for environmentally friendly fuels.

However, regardless of what manufacturer incorporate into their engines, at the end of the day it is the user who has the ultimate responsibility to ensure they are maintained correctly. It also makes sense that by looking after an engine it will give the optimum performance and is less likely to break down.
When you've replaced your mats 3-fold, ours will still be there.

3yr guarantee to 6yr life expectancy

Winter Tee Mats and Frames available in assorted sizes and surfaces. Call now for samples, brochure and price list. Orders now being taken for the coming winter season.

No 2 Extons Units, Market Overton Industrial Estate, Market Overton, Nr Oakham LE15 7PP
Fax: 01572 768261

Available from any leading Golf Course Supplier

FOR COMPACT TRACTORS FROM 20HP.
Specifically designed for use on sportsturf, it can be fitted with various digging chains or a high performance slitting wheel.

The optional soil clear-up system folds up for easy transport.

Affordable, perfect drainage, cable laying etc.
