By Joel Jackson, CGCS

Tim Hiers never leaves you wondering where he stands on an issue. Speaking with the conviction and zeal of a backwoods preacher and the authority and confidence of a corporate officer addressing a shareholders meeting, Tim delivers his message.

At a recent Treasure Coast GCSA meeting, Tim gave a presentation on Integrated Plant Management or IPM as it is known in the turf industry. Originally called Integrated Pest Management, the name has been changed to Integrated Plant Management to reflect a broader scope of turf management. As Tim put it, “IPM is not limited to the use of pesticides. It includes every practical and efficient thing you do to manage turf!” Tim is convinced, that if you are not paying proper attention to safety, training, record keeping, equipment maintenance, and cultural practices, you can’t have a very effective IPM program.

In today’s environmentally conscious world, it is imperative to demonstrate our knowledge, sensitivity, and concern for proper stewardship of our natural resources. While understanding and implementing an effective IPM program is essential, it is not enough according to Tim.

“All of us in this room are ultimately responsible for the problems we face from the growing concerns over environmentalism! We have participated in our associations, we have attended meetings and seminars, we have read our trade publications, but we really haven’t done our share! If we would have worked half as hard for our position as those who work against us, we wouldn’t be in this defen-
Every practical and efficient thing you do to manage turf

ductive position we are in right now. I don't know if the people who oppose golf courses and the use of chemicals operate out of ignorance or are just willfully ignorant. I can’t tell the difference. The results is still the same.

“Some folks out there share our philosophies, but they don’t understand our business. Just because we have some positive results from an experiment that supports our position, it is not enough. I hate to use this overworked cliche, but we do need to become more pro-active. We have to be able to change people’s perceptions of our business. At the same time we must understand their positions and provide them with information that will enable us to find reasonable, sensible solutions to our differing viewpoints.”

Tim didn’t want the audience to get hung up on jargon and buzzwords when it comes to IPM.

“While scouting, mapping, and threshold levels are sophisticated aspects of an IPM program, the simple task of making sure your mowers are sharp and set properly are just as important! Dull mowers can injure grass blades making them susceptible to disease.” This may require an extra fungicide application to control the disease.

Tim continued, “One of the statements I keep hearing from people about using IPM is that we will have to sacrifice the condition of the golf course. I totally disagree with that comment! There may have to be some concessions to the speed of the greens and the shade of green of the grass, but the quality of the turf and the traditions of the game can be preserved very easily. Members want to brag about the speed of their greens, but they can’t putt them. I observe players every day failing to make putts on these greens that they demand to be kept at speeds of 9, 10, or higher. Maybe a few players can negotiate the ultra fast greens, but the majority can’t.

It has been demonstrated that the cost

GO AHEAD!
Take Your Best Shot.

We’ve been setting the standards for Commercial and Industrial sand for 47 years.
Choose from 80 different grades including the finest:
- Greens Mix Sand • White Trap Sand
- Choker Sand
- Dry, Sterilized Top Dressing Sand
- USGA Peagravel
All our sands meet USGA Requirements

For the best product and customer service, call one of our three Florida locations today.

MARCH/APRIL 1992
of maintenance goes up in proportion to the speed. Shorter blade produce shorter roots which makes the turf prone to disease and wear. We can reduce the amounts of water, fertilizer, and pesticides by using sharp mowers, reasonable heights of cut, and consistent cultural practices. At the same time we can produce a consistent, healthy, playable putting surface.”

Tim then commented on a series of examples of IPM practices that reduced the use of water, fertilizer, pesticides and labor. I'll call them Tim's Tips:

**OUT-OF-PLAY AREAS**

On every course there are areas that are not in play but are grassed and must be maintained. Some are difficult and time-consuming to mow and keep attractive. Here are some suggestions to deal with those areas.

1. Depending on your region, consider the use of ground covers. We use wedelia with its colorful yellow blossoms. Rather than mowing weekly, we mow it twice a year.

2. Don't fight hard to manage turf in dense shade under a tree. Remove the turf. Try mulch and/or shade-loving native vegetation. Ornamental shrubs or annuals might also be an alternative.

3. Consider seeding out-of-play areas with wildflowers. Some temporary watering may be needed to get the plants established. Our wildflower patch was the talk of the club last year. It made a great accent. We did have to hand weed the taller weeds like dog fennel and remove some oak shoots every two or three weeks, but it was at minimal cost.

4. In some dry weedy areas, it may be prudent to install some low-volume irrigation heads and plant turf if the area is easy to mow. This may save labor in the long run and definitely gets the mowers out of the sand which is quite harmful to machinery.

**IRRIGATION**

1. Don't overwater! Overwatering can contribute to compaction and wear problems which can lead to weed problems. Other negatives: poor oxygen levels in the root zone, nutrient leaching, disease susceptibility, and unnecessary wear and tear on your irrigation system.

2. The new computerized irrigation systems have been very helpful in managing energy costs and water usage. Not everyone has this tool, but everyone can customize his watering practices to be as efficient as possible.

3. Test your irrigation water for pH and overall quality. You may be aggravating your turf maintenance problems and costs. There are additives and filtration systems that may be helpful.

HEAVY DUTY
VERTI-CUT PROGRAM

Benefits —
A Beautiful Regeneration of Turf thru:
• Less compacted turf
• Drought tolerance and prevention of disease & fungus
• Better drainage
• Better absorption of water and fertilizer
• Creates deeper root structure
• A light aerification
• A level fairway – for player satisfaction
• Plus, clippings used for sprigging sparse growth areas

VERTI-CUT PROFESSIONALS, INC. has the Machines and
Manpower to give you what you want at an
ECONOMICAL PRICE!

Call for a FREE Demonstration!!

• A Light Duty Cut is also available. We will meet or beat any
  competitor’s price — Heavy Duty or Light Duty!!!

• Specially designed and engineered HEAVY DUTY Verti-Cutters
  built to needed specifications, powered by high horsepower tractors
  and vacuumed with Brouwer-Vac. Thatch removal, plus aerification
  through use of 12” baldes with a penetration of 1” to 1½”.

• Nine to eighteen holes GUARANTEED per day — UNIFORMITY —
  and less playing downtime.

We look forward to doing business with you.

J.W. Fulwood, Owner

DRAINAGE

This is a complement to irrigation. Waterlogged areas produce unhealthy and often unmanageable turf. Consideration should be given to installing drainage lines to solve chronic problem areas. You might also look into using wetting agents to help water pass on through the soil profile.

FERTILITY

1. Take soil samples before major fertilizing. Don’t buy and apply materials you don’t need.
2. Call your local agriculture inspector and have him come and take a sample of your fertilizer purchase. Sometimes you don’t get what you pay for.
3. Gravitate toward using a higher percentage of slow release fertilizer in your blends. This will help prevent the possibility of nutrient leaching.
4. Make sure your fertilizer spreaders are calibrated.
5. Consider the use of new biostimulant and humic acid products. Some research has shown some surprising results.

TREE MANAGEMENT

Trees can be a very controversial topic at a club. While it may be very desirable and prudent to plant accent trees for aesthetics and screening, it may be equally wise to consider removing trees or thinning out trees that are causing severe turf management problems which translates to higher costs for labor and chemicals to keep the affected areas playable. When tree roots and grass roots are in competition the tree always wins. Here are some ideas to consider.

1. Selective clearing. Remove selected trees that are blocking sunlight and air circulation. To mitigate the removal of harmful trees, plant replacement trees in out of play areas that won’t impact the turf.
2. Root pruning. Our root pruner cost $2,700. It has paid for itself many times over by eliminating the competition between tree and grass roots. I have discovered tree roots that have extended 50 to 75 feet beyond the tree canopy into turf areas. We have achieved some dramatic improvements in turf quality by pruning the roots of the offending tree. There is a new product out called Bio-barrier which can keep tree roots from encroaching where they aren’t wanted. It may be something you want to consider.
3. Pine trees. Pines don’t like grass around their roots. Keep the root zone mulched with pine straw. Pines also don’t like high pH water.

TRAFFIC CONTROL

Golfers only understand damage they can see. They don’t understand the cumulative effect of soil compaction with the reduction of pore space which leads to poor water percolation and poor air exchange.

1. Try to vary traffic patterns using barriers. We use a 4 x 4 timber across the end of our paths, and move it every two or three days. You can also try signs and roping to vary the traffic flow.
2. In severe cases consider redesigning the path.
PESTICIDES

As you can see by all the topics discussed so far, Integrated Plant Management is more than just managing the use of pesticides. Healthy turf requires less dependence on chemical applications. But when chemicals are used:

1. Read the product label. Be aware of and abide by all restrictions on the label with regard to operator safety and product rates and application restrictions.

2. Pesticides should be used only by licensed applicators. Your pesticide technician should be sent to productive seminars for continuing education and training.

3. The decision to spray should be carefully considered and based on weather conditions, acceptable pest threshold levels and damage, and pest life cycles.

4. Spot treat problems rather than apply chemicals wall to wall whenever possible.

5. Rotate products used so that pests don’t build up chemical resistance.

6. Schedule chemical applications in conjunction with seasonal turf renovations to maximize their efficiency.

7. Consider the use of biocontrol products to minimize use of traditional chemicals wherever possible.

8. Have your club support turf research by including a line item for turf research in the maintenance budget.

9. Check the pH of your spray water. High pH water reduces the effectiveness of your chemicals. A few drops of muriatic acid if needed can buffer your solution.

10. Scouting and mapping of actual pest populations can help plan your spot treatment applications and save wasted travel time by your operator.

11. Ron Andrews of the Grand Harbour Club achieved significant mole cricket control in his fairways by hand-applying Oftanol or Orthene to nymph tunnels with a one-gallon sprayer during the spring hatching period. To achieve this 60% to 80% control he estimated he only treated 4% of the total fairway area.

SUMMARY

There are some very sincere people, who out of ignorance or willful ignorance are very vocal about their opposition to the golf industry. We have to be able to talk to these people and educate them about what we do, and about the positive benefits of golf courses in their communities. In order to speak accurately and confidently about what we do, we must go about our business professionally. We cannot proclaim ourselves good stewards of the environment if we aren’t good stewards of our own maintenance operations. Attention to details and sound management practices are the cornerstones of a good IPM program.

TAKE THE HAZARD OUT OF GOLF COURSE LAKE MANAGEMENT.

LET US SHOW YOU HOW!

Aquatic Systems, Inc. provides:

- Algae & Aquatic Weed Control
- Floating Fountains & Aerators
- Wetland Mitigation & Aquascaping
- State Permitting & Reporting
- Water Testing & Lab Analysis
- Grass Carp & Sport Fishing Stocking
- Clarification Treatments

LOCATIONS THROUGHOUT FLORIDA:

St. Petersburg • Ft. Pierce • Ft. Myers • Longwood • Miami Pompano Beach (Corporate Office)

Aquatic Systems, Inc.
ENVIRONMENTAL SERVICES & PRODUCTS
Turf Industry Roundup

**Waterworks features two Florida superintendents**

*Lesco* has released *Legacy*, a low-growing turf-type perennial ryegrass for overseeding. *Aquatrols* has reformulated *AquaGro*® soil wetting agent and renamed it *AquaGro™ 20-S*. *Turf-Tec International* has a new field tissue test kit for nitrate-nitrogen in turfgrasses. The company's new *Verti-Slicer* aerifies a course without materially disturbing play. *Standard Golf's* 1992 catalog includes several products designed to satisfy specific superintendent requests, such as a debris rake that picks up pine needles and other small objects.

*Aquatrols* has featured two Central Florida golf course superintendents in the January issue of *Waterworks*: Keith Van Hook at Mountain Lake CC and Jim Rowland at Lake Wales CC. Both use the company’s *AquaGro™ S* wetting agent to combat problems caused by the sandy soil of Florida’s Ridge.

Charles R. Nash has been promoted from business manager to business director for ICI Professional Products. William D. McClellan is the company’s new national technical director, replacing Richard Gouger, who retired March 1, and Doug Mills has been promoted from turf products manager to communications manager.

Susan Samudio and Mark Sellman have been promoted to associate breeders for *Jacklin Seed Co*. Samudio worked with perennial ryegrasses and Sellman continues to work with fine fescues.

Bob Henderson has been promoted to manager of controller operations for the Rain Bird companies. A graduate of Brown University, Henderson will continue as plant manager for Clemar Manufacturing Corp. in Claremont, Calif. Ed Eduok has been appointed senior forecaster for Rain Bird’s agriculture, golf and parts markets. Dirk Lenie is the company’s new managing director of sales and marketing for the golf division and Bob Finkenbiner is one of his new product managers. Roy Straight has been appointed plant manager of Anthony Industrial and June Kubota is a new marketing assistant in the golf division.

James B. Smith is the new general manager of *Ceres Products Corp.*, based in Azusa, Calif.

George Hamilton will coordinate Penn State’s two-year turfgrass management program. He replaces Dr. Joseph Duich, who has retired. A graduate of the turf program, Hamilton earned a master’s degree in agronomy from Penn State and has been in charge of the university’s Landscape Management Research Center since 1982.

Kerry Haigh, has been promoted to senior director, tournaments, by the *PGA of America*. The 32-year-old native of England had been director of Tournament Operations. Jorge Quintero has left his own development consulting firm to become the association’s director of golf course development.

The January *PGA Merchandise Show* in Orlando attracted 27,774 buyers, an increase of more than 4,000 over last year’s record-setting attendance. More than 2,000 buyers came from foreign countries. Addition of space at the Peabody Hotel across the street from the Orange County Convention Center enabled the number of exhibitors to increase to 707.

Robert Trent Jones Sr. received the Golf Course Builders Association of America’s Don Rossi Humanitarian Award.

Paul Fullmer, who has guided the development of the American Society of Golf Course Architects as executive secretary for 22 years, has been named the 1992 winner of the organization’s Donald Ross Award.

John R. Sullivan, CCM, general manager of the Grosse Point (Mich.) Yacht Club, was elected president of the Club Managers Association of America at the organization’s annual conference Jan. 16. Other new officers are Richard Kolas, Tucson, Ariz., vice president; William Schulz, Houston, secretary-treasurer. National director from Florida is Jay DiPietro, Boca West CC.
Spray Stoller's N-HIB GA + TRUE-FULLY + UREA NITROGEN in the same application for healthy, long lasting emerald green turf. N-HIB GA stabilizes urea nitrogen so it remains available to turf plants, instead of evaporating as a gas, or leaching. TRUE-FULLY feeds essential chelated iron and manganese. TRUE-FULLY Fe + Mn is the top performer in all soil conditions. It has no to little stain factor. TRUE-FULLY Fe + Mn is fast becoming the turf professional's choice for the 90's.

Spray STOLLER'S SYSTEM GREEN and enjoy 60 long days of emerald green color.
NOTE: The following report by Dr. Tom Latta, chairman of the Florida Turfgrass Association External Affairs Committee, is edited from a mail-out five weeks ago to FTGA members. Many changes have occurred since then and may continue to occur when the Legislature meets in special sessions. The Update notes were added on March 13. The FTGA External Affairs Committee will bring you a legislative recap in a future issue.

It is not appropriate for an employee of a club to publically speak out on sensitive issues which might affect the operation of the club without the approval and support of the membership and officers. However, as a taxpaying citizen, you do have a right to express yourself to your elected officials concerning pending legislation which can have a disastrous effect on common sense turf management. — Joel Jackson.

BY DR. T. M. LATTA
CHAIRMAN, EXTERNAL AFFAIRS COMMITTEE, FTGA

Many bills introduced this year have the potential to affect turfgrass interests. This summarizes the major issues.

**Fertilizer Bill**

*Senate Bill 1520 (Senator Souto)* This is a major rewrite of the existing fertilizer bill. The major controversy covers the fee for registering a fertilizer. (Fee hikes are in the wind. The State has no general revenue money to support such programs. The current thought is that fees raised by the activity must support the costs of the activity.)

**Pesticides**

*House Bill 2431 and Senate Bill 1430:* That part of the Florida Pesticide Law dealing with applicator certification is up for sunset review this year. The Senate is dealing with the issue narrowly: reenact the applicator certification language in Ch. 487. The House of Representatives took a much more ambitious approach, and rewrote the entire Pesticide Law as PCB RR 92-19.

If anyone has read Ch. 487 recently, you know what a confusing statute it is. Definitions appear in multiple locations, there is little consistency or flow to the language because the statute was created at different times in different Legislative bills. This product by the House Regulatory Reform staff is a major consolidation, and is an excellent effort. Surprisingly, there has been little controversy so far about the House bill, despite some language, long sought by people in the industry, making clear that the Department of Agriculture has exclusive State regulatory authority over pesticides.

[UPDATE: A major controversy has erupted over preemption and the outcome is uncertain at this writing.]

**Preemption.** You’ve undoubtedly heard the Supreme Court decided in the Casey, Wisconsin case that FIFRA does not preempt local regulation of pesticides, including pesticide use. Enacting regulations on use was up to the states (as long as these do not conflict with or expand upon Federal regulations. Bottom line: states can do what they want.

Florida law has been silent on the subject of exclusivity. Some departments, water management districts, regional planning councils, cities, and other government organizations attempt on occasion to regulate pesticide use through permits, development orders, licenses, etc. This year we made a major effort to get this regulatory authority clarified by having the statute declare unambiguously that the Department of Agriculture and the Florida Pesticide Law provide the sole regulatory framework for pesticides. The reasons for this are threefold:

1. If local jurisdictions can establish conditions of use, they have an obvious registration function. Their demands for additional data, backup and support upon manufacturers will impose an additional cost burden on registrants. It also weakens the registration functions of both the Department of Agriculture and EPA. Manufacturers will not know who has the final authority governing product registration. The inevitable consequence will be the withdrawal from Florida of products and registrations we desperately need.

2. Pesticide users should know the rules of the road and these rules should not change with every county or city line. Also, city and county regulations are often under-publicized (in ordinances) or completely hidden (in permits, occupational licenses, or other file drawer documents). It will be almost impossible for a person to know the rules of pesticide use, how to comply with them. Furthermore, a pattern of infractions could checkmate the use of pesticides, even by conscientious professionals.

3. Regulatory decisions on pesticides should be made in a scientific forum, not driven by public hysteria, emotion, political posturing, or grandstanding. Often, unfortunately, local public policy discussions on pesticides are carried out in newspaper headlines, rather than in reasoned technical discussions. This opens a tremendously fertile ground for abuse. Preempting pesticide use regulations to the State level helps ensure (but does
