Introducing the First Complete Line of Potassium Nitrate-Based Turf Products.

Supported by Research
You've read the studies. A desirable ratio of potassium and nitrogen makes stronger turf requiring less maintenance. You know this is a higher ratio of potassium to nitrogen than you're applying now.

Controlled-Release: the Key
But what choice have you had? Controlled-release materials are the basis of advanced turfgrass fertility programs. And until recently, controlled-release potassium nitrate has not been available.

Now K-Power's MultiCote® controlled-release coating allows you to apply the benefits of potassium nitrate-based fertilization across your entire program: Greens Grade, Fairways, even Combination products.

K-Power® Builds Stronger Turf
K-Power's potassium helps turf plants better regulate water levels in their tissue and increase cell wall thickness. The plant is better able to resist temperature and drought stress as well as fungus and insect attacks. Without costly chemical treatments. Stiffer leaves support the golf ball for better shot-making. Even if you mow a little higher. Clippings are reduced because K-Power's desirable ratio of potassium to nitrogen reduces the rate of leaf growth.

And the low salt index of chlorine-free K-Power potassium nitrate makes it one of the safest turf fertilizers available.

Unique Formulas
The Greens Grade line includes the only ammoniated homogenous products that combine the benefits of methylene urea and potassium nitrate.

The Fairway Blends provide a unique 50/50 ratio of controlled-release nitrogen to controlled-release potassium. For the growth and green-up you need. When you need it.

Trial Programs
Contact your distributor for more information on K-Power and the world's most perfect trial program. Or call us at 1-800-227-2798.

(It's about time.)
then it seemed I just moved them around the course. I was generally using the cheapest product on the market, but began to notice that even at higher rates, I was wasting time and money.

Then I began listening to fellow superintendents talking about mapping heavy areas with the idea of getting a jump on them next year (a strategy that I was already using for preemergent weed control for the same reasons mentioned above).

This led me to my present program which consists of a granular product on my tees and greens after my spring aerification and verticut (usually mid May), the same product would be used on other targeted areas. I have had good response with Crusade the last couple of years.

Then right after this application I pump a wetting agent through the irrigation system as I do every month to help get the product into the soil. The balance of the summer I must admit I am back on the hit-or-miss approach.

I do believe that my changing of the chemical helps. I will use other granulars, switch from Orthene to Pageant, and use baits later to get the adults that survived all that.

I have done this cheaper with better success than the old program of spending all my budget by trying to go wall to wall with the least expensive product too late. I am very interested in the idea of biological control but at this time this approach is a little out of my league here.

I will have to let my bigger brothers try this approach first. This may prove to be the most cost effective and environmentally sound approach yet.

Karl Schmidt
Lucern Lakes GC, Palm Beach

Year-around problem
In South Florida mole cricket control is a 12-month-a-year problem. Control strategies include proper timing of insecticide applications in the spring for control of nymphs, to spot-treating problem areas in summer and fall, and hand-treating active crickets in winter on putting surfaces. The following information will describe the most effective methods I have utilized.

Hand treatment on greens
An educated staff and soap flushes are two good tools to assist in timing a spring pesticide application. I have had good experience with Crusade in muck soil conditions over the last couple of years. Target areas typically have been teetops and slopes, bunker slopes, approaches, collars and green slopes.

This is also a good time to treat areas that suffered severe damage in rough and fairways in late summer of the previous year.

Spring/summer/fall adult control
A successful mix for me has been: 3 1/3 lb Orthene, 1 qt Coax, per acre This tank mix buffered to a pH of 6-6.5

GIVE MOLE CRICKETS WHAT THEY DESERVE... A LAST MEAL!

Performance of this tank mix increased significantly when we buffered the mix to bring down the pH.

High-pressure injection

Dursban, Orthene, Turcam, all provided excellent results when injected with a 550-gallon, 650-psi, PTO-driven injector. Rates of 550 gallons per acre made this a slow application process but the control achieved provided an excellent option for problem areas. (Don't forget to buffer pH)

Proact Nematode for control

I worked at one of the research sites for this project in the late 1980s. Although the research on our course showed the project was a failure, the turf condition in all areas was dramatically improved. These areas previously needed to be sodded annually at the end of every season and now were providing consistently healthy playing conditions.

Mapping damaged areas

A useful tool for our operation is to post a detailed course map that can be used to identify areas of high cricket activity. Marking problem areas throughout the peak activity season will provide useful tracking that can be reviewed to plan strategies for spring nymph control the following year.

Robert G. Klitz, CGCS
Deer Creek CC,
South Florida Chapter

Begin with mapping

Our mole cricket control program begins with each course mapping out infestations, which usually begins in mid February. This is when the first mating flights occur. Next, weekly soap flushes are performed to monitor the nymph development.

Once a viable population is observed, late afternoon/early evening topical sprays are employed. We like to time these if possible with the full moon or any significant rainfall which increases mole cricket activity. This process is repeated through June.

At this point, any heavy pocket infestations are treated with granular insecticides and watered per label instructions to achieve control. Again, soap flushes are used before and after to determine a rough percentage of control. This process is ongo-

A trapping station was developed by IFAS to expose mole crickets to nematodes during early trials of the biological control that has since proven successful.
"For the Nestle Invitational the Greens were the Best Ever! Laser Did An Excellent Job."

Dwight Kummer, GC Supt.
Bay Hill Club, Orlando, FL

If you want darker color, excellent heat and traffic tolerance, smoother spring transition and proven, tournament-quality performance use Laser for your overseeding program. It worked at Bay Hill, it will work for you.

Apply 100% Laser Poa trivialis at the rate of 10-13 lbs/1000 sq. ft. mid-fall. For heavy traffic courses, like Bay Hill, that receive 250+ rounds per day, you may want to supplement the original overseeding with an additional 2 lbs/1000 sq. ft. on a weekly basis late December through January.

Note: Laser Poa trivialis can also be blended with turf-type perennial ryes, such as Palmer II or Prelude II for Southern overseeding programs.
Work very hard early
At Lake Region we are very fortunate that we do not have a severe mole cricket problem.

We have a piece of property that doesn’t have any homes or any development except the club itself. This helps to keep the crickets to a minimum by not having to worry about any fly-ins.

For mole cricket control we use just a few different avenues for treatment.

Over the past years we have made maps of all the areas that get activity early. Usually in May we start to see the hot spots begin to show activity. We will immediately treat these hot spots with Mocap. If we get these spots early, it seems to dictate the rest of our year with crickets.

After that application we keep a close eye out for them and will use Orthene when they reappear. We will treat our greens with Triumph in the summer to help with crickets and nematodes also.

Last year we used some baits, and had good results, but I prefer to use Mocap and Orthene as my main sources of control.

As I have said though, I do not have a major mole cricket problem. If I had a devastated area the size of a carryall bed, that for us would be a huge area. We are very fortunate not to have a problem.

We work very hard early and just don’t let them get too far before we go after them.

Alan Puckett
Lake Region Y&CC, Ridge Chapter

Program never ends
My mole cricket program really never ends at Colony West.

We start with soap flushes in late April to early May to get an idea of the size and species of mole crickets and to determine when the majority are hatching. We then map the areas of activity to keep a historical record of the location of activity throughout the years.

Two weeks after the majority hatches (about first or second week of June) we apply either Oftanol, Turcam 2 1/2G, or Crusade to the fairways and roughs.

Also at this time we apply Triumph or — if nematode counts are high — Nemacur 10 G to the greens and tees.

After we make our applications, we return to the mapped areas and check for survivors. This gives a more accurate picture of the effectiveness of the treatment than body counts alone.

We continue to monitor for activity from July to October. If we see an increase in activity, we spot-treat with either baits or Orthene. The best results occur when making this application in the evening, after the noon rains have passed.

From November to March, if all went according to plan, the mole crickets that survived the summer are not in sufficient numbers to cause any damage that would require treatment. We only make treatments during this time of year when damage occurs on the greens.

Dale Kuehner, CGCS
Colony West CC, South Florida Chapter

Hatching earlier this year
Mole crickets this year appear to being hatching earlier than they have in the past.

Normally we have tried to achieve our best control in early July with Mocap or Orthene. This is the time of the year when we have experienced heavy feeding and we feel most eggs have hatched.

However, this year there seems to be more activity than usual in early June and we have scheduled an Oftanol with fertilizer application for this month. Oftanol has not been used at Isleworth in several years as we anticipate a high level of control.

We will continue to treat hot spots with Orthene through August at which time we will switch to baits. We experimented this past winter with some newer products like the third-generation pyrethins which seemed promising.

Again, we still feel that timing is the most important key. Choosing the right product for the development stage the mole cricket is in will give the best results.

Buck Buckner
Isleworth GC, Central Florida/Ridge Chapters

More biological controls
Control of Mole Crickets for summer, fall and winter of 1993 and spring of 1994 has been very successful. Our plan of attack for summer, fall, and winter of 1994 will be similar to 1993.

The slight modification we plan this year includes more biological control (parasitic nematodes, ProAct), and the addition of Turcam to our arsenal of weapons. I feel that the success of 1993 had a lot to do with the use of parasitic nematodes. We will continue to monitor areas treated biologically, and will hopefully see great results in 1994.

Bob Bittner, CGCS
Club at Pelican Bay, Everglades Chapter

Knock out the nymphs
At Meadowbrook, we strive to control mole cricket populations by hitting them hard and early in their nymph stages.

We inject Mocap (75 lbs/acre) on fairways in mid June and apply Crusade (80 lbs/acre) on green slopes and irrigated rough areas. Control of mole crickets on our greens in achieved by using Orthene (4 lbs/acre) applied with Down-n-Thru (30 oz/acre). We also keep solutions of Orthene in spray bottles on greensmowers and spray any mounding activity we see.

To help us control the bigger crickets in late summer, we apply Triumph (1.5 oz/1000 sq. ft.) on our greens, tees and approaches. We continue to spray Orthene on any hot spots that turn up during the year.

Since we try to hit mole crickets when they are young, it is imperative to know where they are on the course, therefore we map extensively in the summer and fall. When we have a warm period in the winter, we take special note of any cricket activity. We have found a little activity in the winter signifies extensive cricket damage in the summer and fall.

Craig Boller
Meadowbrook GC, Seven Rivers Chapter

Totally changed philosophy
Although mole crickets represent the number-one pest problem for superintendents during the summer months, I have
FOR YEARS THE BEST SOURCE FOR TURF CHEMICALS HAS BEEN RIGHT UNDER YOUR NOSE.

SUBAQUEOUS SERVICES INC.
4201 KEAN ROAD, FORT LAUDERDALE, FL 33314
SERVING FLORIDA FOR OVER 20 YEARS
Timeless durability, reliable power and unsurpassed cutting quality. It’s no wonder why Groundsmaster riding rotaries remain the standard to which all others compare.
The Proven Performers

For 20 years commercial mowing professionals have put Groundsmaster® 300 Series through rigorous tests against time and terrain. And for 20 years the 300 Series continue to be the preferred choice among these same professionals. They have come to rely on these commercial mowers to handle even the most extreme cutting conditions with unmatched productivity.

The proven performers. Long on durability. Tight on turns. With power to spare. Today the 300 Series continue to advance your expectations in measures of reliability, efficiency and unsurpassed quality of cut.

Whatever your situation or application, there's a Groundsmaster to serve your utmost demands.

Power-Packed

Service life is optimized with these liquid cooled performers. Durably built engines, either 25 hp—diesel or 45 hp—gas, offer fuel economy yet plenty of power. The powerful 345 gas version has its power regulated and reserved to effectively increase torque and power while reducing noise and vibration. It also equips a Distributorless Ignition System for increased reliability and less downtime.

Fully pressurized lubrication, heavy duty air cleaners, industrial sized radiator and engine protection systems go a long way to enhance engine efficiencies and keep you on the job.

And routine servicing is so simple it promotes itself. Designed to open wide with conveniently located, easy-to-reach components, saves you time and fosters proper servicing.

Incredible Control

Groundsmaster design continues to evolve in response to the specific demands of today's turf professional, even meeting future expectations. Toro understands that exacting control, superior traction and a comfortable ride improves operator performance making the job easier, faster and ultimately more profitable. To that end, there's front wheel drive, rear wheel power steering, single pedal forward/reverse action, a compact wheelbase and individual drum wheel brakes. All for incredible, smooth control and effortless maneuverability whether trimming close, transporting or trailering.
Traction-Plus

Traction and stability are the emphasis with extra large turf tread tires and, a counterbalance system that automatically transfers weight between the deck and tractor when performance demands additional traction.

For enhanced traction the Groundsmaster 325-D with 4-Wheel Drive excels in traction where competitive two-wheel differential lock types can't. Toro's 4-wheel drive features an on-demand overrunning clutch that prevents rear wheel skidding in turns and ensures excellent traction.

Operator Comfort

Providing Groundsmaster operators with excellent control lessens the fatigue experienced from a long day's ride. And a comfortable operator's station with excellent visibility extends to consistent operator performance and productivity.

For ultimate comfort, the high back, foam cushion deluxe suspension seat adjusts to individual operator's weight and length. Armrests afford relaxed steering plus the steering wheel tilts for individual steering preference.

Easy to mount and dismount, the uncluttered operator's station provides plenty of foot room with conveniently located brake and traction pedals.

Independent wheel brakes optimize control and lock together for smooth, even braking power.

A full instrumentation panel offers easy-to-read gauges for monitoring all engine functions and easy-to-reach controls for operator efficiency.

Four link power assist steering with optional cruise control significantly raises productivity.

And upfront implement positioning affords maximum visibility and maneuverability.
Versatile Cutting Unit Family.

Toro's Groundmaster® 72" Side or Rear Discharge Cutting Units have a reputation for cutting in areas and at speeds that others can't.

Durably built with 11 gauge steel construction, heavy duty spindle housings, splined spindle, tapered roller bearings and welded blade adaptors; these decks are more rugged, require less servicing and last longer.

Optimally designed, a deep 6" Wind Tunnel® housing and three 25" blades create superior vacuum action for a smooth, even cut, even dispersion – at no loss of ground speed.

Four solid rubber deck caster wheels optimize ground contour following. Scalping is virtually eliminated with antiscalp features like oversized antiscalp rollers and adjustable skids.

Fine Cut Flail 2760

Named for its high quality of cut and exceptional striping characteristics, Toro's Fine Cut Flail is a worthy alternative for mowing your formal and semi-formal turf. The 2760 performs without clumping, not even in heavy wet grass. And, its full width rear discharge further enhances after-cut appearance while it also makes for safer operations.

But its versatility may be its greatest advantage. The same mower that delivers you a praiseworthy cut can serve to scalp prior to overseeding, break up aeration cores or mulch leaves. All without the hassle of changing or adding attachments.

Durability features of the Fine Cut Flail ensure a lasting performance:
- Built with heavy duty 10 gauge steel and 7 gauge reinforcement braces.
- Floating blades move freely to prevent breakage when striking hard objects.
- Reversible rotor extends blade wear.
- Rotor and roller shafts have greaseable ball bearings.
The Guardian® 72" Recycler®

Another member of Toro's proven cutting unit family provides commercial recycling capabilities that will enhance your performance in areas of safety, productivity and after-cut appearance.

Guardian is a commercial recycler innovatively designed to cut without discharge. With the absence of discharge you create a safer mowing environment. “No discharge” offers time saving benefits that go a long way to increase your productivity, too! The need to collect and dispose of clippings is eliminated. Trimming maneuvers can be approached from either side. And it's easier to trailer.

Toro's commercial recycler is designed with special deflectors that cycle clippings to be cut and recut, forcing the smallest of clippings back into the turf. This unique vertical discharge system prevents windrowing and provides an after-cut appearance you can be proud of.

Guardian is solidly built to power against rugged conditions. Its patented design includes these features:

• Proven heavy duty spindles
• Anti-scalp cups and rollers for smooth ground following
• Patented rear castor isolation system
• Quick release covers for ease of servicing

Excellent mulching capabilities take the "chore" out of fall clean up.

All Groundsmaster 300 Series prime movers, except the 327, retrofit to the Guardian 72" Recycler. Take advantage of this deck of the future and experience the safety of no discharge with maximized efficiency for a quality of cut that's unsurpassed.

Toro cares!, and wants to remind you that no product is a substitute for sound safety practices. Always clear away debris and do not mow when people are in the operating area.
Groundsmaster® 300 Series are versatile professionals with year ’round accessories.

**Cab With ROPS.** Completely enclosed cab loaded w/std. features turns your Groundsmaster into an all-weather vehicle. Heater and light kits optional.

**2-Stage Snowthrower.** Big 48” two stage snowthrower with adjustable skids. Directional discharge chute is electrically adjusted from operator’s seat; 180°. Driftbreaker auger and oversized second stage clears snow in a hurry and prevents clogging.

**Debris Blower.** Forceable winds effectively clean sidewalks, parking lots, tees, greens, fairways.

**2-Post or 4-Post Roll Over Protective Structure (ROPS).** Includes seat belt and optional canopy/sunshade with acoustical roof insulation.

**V-Plow.** Rugged, 48” V-plow for snow has front skid and reversible/replaceable scraper blades for low cost snow removal. Requires special mounting kit.

**Rotary Broom** for a variety of uses; sweeps parking areas, walkways and turf of dirt, debris, leaves and snow. Minimizes hand labor.

**Aero-Seeder.** Drops seed into parallel slits in the ground with adjustable rate and seed size.

**2-Post or 4-Post Roll Over Protective Structure (ROPS).** Includes seat belt and optional canopy/sunshade with acoustical roof insulation.

**Aero-Seeder.** Drops seed into parallel slits in the ground with adjustable rate and seed size.

**Speed Control.** Lets you set your unit for a continuous operating speed. Automatic override when operator moves drive pedal or operates brakes.

**Core Pulverizer.** Quickly and efficiently pulverizes cores and topdresses after aeration.

**Aerator.** Easily installed, self-propelled operation and out-front vision increases productivity. Available with ¾” tines.

**Leaf Mulcher.** Made of heavy gauge steel, the leaf mulcher mounts under side discharge decks allowing blades to vacuum and pulverize fallen leaves.

### SPECIFICATIONS COMMON TO GROUNDMASTER 300 SERIES PRIME MOVERS

| RADIATOR | Mid-mount industrial radiator with tube and fin construction; 7 fins per inch. Approx. 6 quart (5.7 liter) capacity. Stamped top and bottom tanks with hydraulic cooler in lower tank. Thermally stable water cooled hydrostatic system regulates operating temperature, (adjusts seasonally). |
| TRACTION DRIVE | Variable speed, axial piston, hydrostatic in-line transmission; charge circuit hydraulics with 25 micron filtration provide hydraulic flow for power and implement lift. Transmission mates to drive axle; 20.9-1 reduction. Approx. 5 quart (4.7 liter) oil lubricant capacity. Single foot pedal control of forward/reverse ground speed. Optional Electronic Cruise Control Kit, Model 30677, available. Model 30795: Rear axle is mechanically driven from front axle by a universal shaft. An on-demand overrunning clutch prevents rear tire scruffing in turns and maintains turning radius. Approx. 1.9 quart (1.8 liter) gear lubricant capacity. |
| IMPLEMENT DRIVE AND LIFT | 1-1/8" (2.9 cm) splined PTO shaft driven by a tight-sack double "A" section, torque team V-belt. An anti-side load system protects the crankshaft output bearings. Lift cylinder 2.5" x 3.25" (6.4 x 8.3 cm) actuates a T-bar of 2" (5 cm) square structural tubing with convenient attaching chains for implement lift. Two large torsion springs counterbalance implements for greater stability and traction. |
| STEERING | Hydraulic power steering with control valve and metering section which regulates pressure and meters flow to steering cylinder. Steering valve features priority flow which automatically goes to steering function. 13" (33 cm) diameter steering wheel. Tilt steering wheel with a 15° range of movement releases and locks by a single lever control. |
| GROUND SPEED/CLEARANCE | 0-9.5 mph (0-15.3 km/h), infinitely variable. Front ground clearance of 7.5" (19 cm). Model 30795: rear ground clearance of 4.5" (11 cm). Two front traction drive tires — 23 x 8.50-12 tubeless, extra traction tread, 4-ply rating. Demountable drop center rims. Two rear steering tires — Models 30789/30789h: 16 x 6.50-8, tubeless, ribbed type, 4-ply rating. Model 30795: 18 x 6.50-8, tubeless, extra traction tread, 4-ply rating. Tire pressures: 21 psi (145 kPa). Optional extra wide tire and rim: 23 x 10.50-12 tubeless, 4-ply rating. Part No. 62-7020: (not applicable when using cutting unit model 30710). |
| TIRES/WHEELS/PRESSURE | Welded construction steel reinforced with square and rectangular tubing. Individual 7" x 1.75" (17.8 x 4.4 cm) drum type wheel brakes. Parking brakes on front traction wheels. Dynamic braking through traction drive. Optional: High back cushion seat, Model 30708, or deluxe adjustable suspension seat, Model 30772. (Seat Adapter Kit, Model 30709, required with 30772). |
| MAIN FRAME | Two rear steering tires — Models 30789/30789h: 16 x 6.50-8, tubeless, ribbed type, 4-ply rating. Model 30795: 18 x 6.50-8, tubeless, extra traction tread, 4-ply rating. Tire pressures: 21 psi (145 kPa). Optional extra wide tire and rim: 23 x 10.50-12 tubeless, 4-ply rating. Part No. 62-7020: (not applicable when using cutting unit model 30710). | Tool box with latch down cover located in fender. Operator manual storage tube furnished for attachment to seat frame. |
| BRAKES | Two years or 1500 operational hours, whichever comes first. Refer to the appropriate Groundsmaster 300 Series Operators' Manual for further details. | Groundsmaster 300 Series prime movers and rotary cutting units are certified to meet the American National Standard Institute's (ANSI) specifications, B71.4-1990 and applicable Federal and State regulations based thereon. |
| STORAGE COMPARTMENTS | **FULL FLOTATION CUTTING UNITS** |
| WARRANTY | Two 72" SIDE DISCHARGE, MODEL 30722 & 72" REAR DISCHARGE, MODEL 30710 TYPE | GUARDIAN® 72" RECYCLER®, MODEL 30716 | FINE CUT FLAIL 2760, MODEL 44590 |
| TYPE | 72" (183 cm) width of cut, three blade, front mounted rotary. Side or rear discharge respectively. | 72" (183 cm) width of cut, three blade, front mounted rotary. Recycling capability with no discharge. | 60" (152 cm) width of cut, 144 knives rotating at 2300 rpm, front mounted flail. Rear discharge. |
| MOWING RATE | Mows up to 3.8 acres/hr (1.5 hectares/hr) at 5.5 mph (8.9 km/hr). Mowing rate is dependent on conditions. | Mows up to 3.1 acres/hr (1.25 hectares/hr) @ 5.5 mph (8.9 km/hr). Mowing rate is dependent on conditions. | Mows up to 3.1 acres/hr (1.25 hectares/hr) @ 5.5 mph (8.9 km/hr). Mowing rate is dependent on conditions. |

totally changed my philosophy for treatment in recent years. I used to contract out a wall to wall combination application of Nemacur and Oftanol and had much success in the control of mole crickets. There are many obvious advantages to contract applications: from not having to store the restricted-use chemicals on site, not having crew members apply restricted-use chemicals for mole crickets, basically a one-time control application and the list could go on.

But as everyone should be well aware of, we are rapidly moving into an environmentally sensitive world where golf course superintendents are being perceived as bad guys who just go around dumping toxic chemicals on the ground. I know that this image is wrong and for this reason we have made the following changes at Seminole.

We have decided to accept the fact that some mole crickets are tolerable. Our main goal is to prevent major turf damage from mole crickets by making spot treatments when necessary.

Like most facets of golf course maintenance, this requires constant observation of the golf course so that no area becomes too damaged before treatment. I compare this spot treatment for mole crickets to vs. wall to wall treatment of mole crickets to hand-watering greens vs. using sprinklers to water the greens.

In both cases (wall to wall and sprinkler irrigation), I feel that too much water and too much water is being applied.

The big negative to spot treatment is that this control program is harder. It takes more observation time and labor effort to work properly. The trade-off is that we are using fewer chemicals than ever before mainly because we are not trying to control every mole cricket.

As far as chemicals used for the control of mole crickets, we use several chemicals in rotation to maximize control such as: Orthene, Crusade, Dursban and Oftanol. These chemicals are safer to use and are effective whether they are sprayed on or used in bait form.

Timing and proper application are the critical factors in a successful program.

*These nematode products will help reduce our mole cricket population when it gets too high and allow us to continue our spot treatment program, thereby reducing total pesticide usage.*

Everybody knows the chemicals that are labeled for mole cricket control and the rates applied.

Hal Hicks
Seminole CC, Palm Beach Chapter

**Take the IPM approach**

Collier's Reserve uses an Integrated Plant Management (IPM) approach to mole cricket control.

The golf course is scouted in a consistent manner (every week). Areas of mole cricket activity are recorded and soap flushes taken. Damaged areas are mapped because the female mole cricket seems to return close to where she was hatched, as a nymph, to lay her eggs.

Cricket taken by means of soap flushes are measured by length and the average size is determined. This data will help us select which compound we will use for their control.

In mapped areas, during the fly-in period, a bait formulation will be used. We chose a bait formulation because at the time of fly-in, mole crickets will be mature, mobile and hungry. With any liquid product, the tank water pH will be adjusted which ensures maximum pesticide efficiency, thereby saving money and time on costly second applications.

At present, we are lucky to have only a small cricket population needing only spot treatment. In some areas where the mole crickets are not too numerous, a soap-and-water flush is used instead of pesticide application. Late season mole cricket fly-in on the greens will be flushed out rather than using a pesticide treatment.

When necessary, we use Crusade 5G for spot treatment and are experiencing excellent results.

Recently, we began looking at all biological products as an alternative method in mole cricket population control. Two specific biological products we are looking at are Vector and ProAct. These nematode products will help reduce our mole cricket population when it gets too high and allow us to continue our spot treatment program, thereby reducing total pesticide usage.

Our program will change each season to accommodate the variation in mole cricket density; however, we will always map and soap flush to determine what is going on in the field.

Michael Litton
IPM Specialist, Collier's Reserve CC

**DowElanco, BMP**

1) Target treatments... Map and record areas of greatest mole cricket activity throughout the year.

2) Control the younger generations
   • Scout and soap flush in late spring and early summer.
   • Wait until eggs have hatched... Treat 2 weeks after first hatch.

3) Treat with a good residual like Pagesant* 50DF insecticide or Dursban* 50WSP insecticide (4-5 pounds per acre) or at least 2 pounds active ingredient per acre of Dursban granular.
   a) It's best to apply in late evening to moist soil.
   b) Irrigate 1/4 to 1/2 inches after application to move the chemical into the control zone.

4) Make spot treatments throughout the year to control hot spots/new hatchings.

5) Bait formulations of Dursban are effective against adult life stages.

John Demaree
DowElanco

**BioControl, Inc.**

Proact is the biological mole cricket control consisting of the patented beneficial nematode, Steinernema scapteriscus (Ss).

This nematode was found by IFAS nematologist Dr. Grover Smart back in
1985. The nematode was tested for seven years by the University of Florida in both laboratory and field trials, and was made commercially available by BioControl, Inc. in 1991.

Since then, Proact has been applied on well over 4,000 acres of golf course turf, with at least 80-90% success rate.

Proact is most effective against adult Tawny, Southern and Short-winged mole crickets. When the nematodes find a mole cricket host, they enter the body through the mouth or spiracles and make their way to the digestive tract.

Once in the digestive tract, the nematodes release a bacterium that kills the mole cricket within 24-48 hours. The male and female nematodes then mate inside the body of the dead cricket, with up to 80,000 offspring emerging from the mole cricket cadaver within three to five days.

Ss can survive 8-16 weeks in the soil without a mole cricket host, which represents the minimum residual of Proact (obviously, the offspring nematodes are also expected to survive 8-16 weeks).

Proact is best used as a biopesticide against adult mole crickets during the spring and fall seasons.

With the spring application, the goal is to kill the adult mole crickets before they lay their eggs. As a result, Proact should be applied between February and April for optimal results.

The fall application is meant to dramatically reduce the population of adult and later-stage juvenile mole crickets before they start the overwintering process (i.e. burrowing deep for the winter). For best results, golf courses should perform the fall application between August and November.

The key to success when applying Proact is to get the nematodes into contact with the mole crickets beneath the soil surface. In other words, water is imperative to attain the desired results.

When applying Proact with a spray rig, BioControl recommends the golf course superintendent irrigate prior to the application to cool the grass and moisten the soil, as well as afterward to water the nematodes into the soil.

The general rule of thumb for sandy soils is 1/4 inch of water before and 1/2 inch after (although some golf courses would flood half of Florida if they used this much water).

A carrier volume of 50 gallons per acre has proven successful for spray applications. As an alternative to the somewhat traditional method of spraying the product, many golf courses are turning to fertigation, especially for larger applications. Fertigation is ideal because it enables the superintendent to water the product in as he/she is applying it.

**Mole Cricket Brigade**

Each summer we await the arrival of the mighty Mole Cricket.

Recently, we went out as we do each year and conducted soil flushes with soap and water. We start this procedure around the first week of May and continue each week until the crickets start to emerge. Last year the crickets started to come out in the middle of June.

This year, unlike last, the crickets started to come out much earlier. The first soil flush was conducted the first week in May. We counted approximately 30 crickets in a 2 x 4 sq. ft. area.

I thought this was crazy — it is too early for these guys to start coming out. That was the start of our Mole Cricket Brigade.

We started spraying the course in three- to four-hole clusters using different insecticides. Each area is documented for the product used and evaluated for effectiveness. This continues until we have covered both courses.

At that point we continued to spot-spray hot spots. Our objective is to knock down as many crickets as we can early while they’re still small. This has proven most productive and efficient over the years.

This year we have been asked by Miles Chemical — like several other courses in the area — to conduct a test evaluation on a particular insecticide. This is being done with the possibility of adding mole crickets to the label.

We are conducting this test on several plots on our driving range. I hope with the limited insecticides to chose from for cricket control, this one proves to be beneficial for all of us.

**John Gallagher**

**Boca Woods CC, Palm Beach Chapter**

**Can't use the calendar**

A warm winter, like the one that just passed sure helps to evaluate the success or failure of your mole cricket control methods. At our course, the warm winter kept our non-overseeded greens in great shape but it did little of anything to suppress our mole cricket activity.

The best method for control that I have found begins with getting as many nymphs as possible immediately after hatching. This early kill will greatly reduce the amount of adult activity you will receive past the initial hatching.

Every course is different and timing is critical! You can't rely on the timing of the treatment used by the golf course down the road or by using a calendar.

I have heard of treatment dates any where from late winter to early summer for this first hatching. Then of course there's the potential for a multiple hatching, an often occurrence in South Florida!

I have found the most successful method for mole cricket control starts with periodically checking the soil temperature, beginning in late winter. When soil temperatures begin to rise, we use soap flushes at a minimum of once a week until we begin bringing up nymphs.

We use the maps that we keep of trouble areas (adult activity sites) to determine where we do the soap flushes. Once the
