Bonita Bay is a master-planned golf course community located in Bonita Springs on the coast of Southwest Florida where members are serious about the game of golf.

In 1979, David B. Shakarian, founder of Bonita Bay's 2400-acre community, dedicated his career to healthy living and to his dream of creating an environmentally responsible community. He saw the development team as stewards of pristine resources that include rivers, streams and beaches.

Today, 600 acres of natural preserves, 230 acres of lakes and 700 acres of golf courses provide the ultimate habitat for a variety of wildlife and birds. Bonita Bay is bordered by Estero Bay Aquatic Preserve, the Imperial River and Spring Creek.

Slough and mangrove preserves that are federally protected, salt flats and wetlands comprise the majority of Bonita Bay. Additionally, three championship golf courses, community parks and resident neighborhoods make up the remainder of the community. Many may not realize that golf courses provide challenging opportunities for golfers, but also provide habitats rich in local plants and wildlife.

Few were surprised when Bonita Bay's golf courses became the fifth, sixth and

seventh courses in Florida to become certified as Audubon Cooperative Sanctuaries. The program is sponsored by the United States Golf Association and is designed to help golf course superintendents preserve, enhance, encourage wildlife habitats and protect natural resources.

Mark Black took on the responsibility for complying with the program's certification requirements for the first three golf courses at Bonita Bay.

"Our club members and residents have a deep affection for the birds, wildlife and natural surroundings at Bonita Bay. This program is a natural for us says," says Golf Course Operations Director Mark Black, CGCS.

The Audubon Cooperative Sanctuary System "links together" Cooperative Sanctuary areas to form a nationwide system to benefit wildlife and the environment during all seasons of the year. In an organized manner this system will provide habitat for birds during breeding, migratory and wintering periods.

Cooperators are working toward environmental planning, wildlife and habitat management, public outreach and education, integrated pest management, water conservation and water quality management.

"I think it is important to know that the Audubon program is designed to assist golf course superintendents in preserving and enhancing wildlife habitat and to protect natural resources," Black said.

Shelly Foy with the USGA, played a large role in helping us start our Audubon Program. She always made herself available to answer questions and offer support during the certification process.

"Make no mistake, certification is not just a form you fill out and mail along with a fee to join. The program requires hard work, dedication and the desire to become certified. You must give of yourself and involve others," said Black.

Educating our members, residents and friends of wildlife gives us the opportunity to show our commitment and dedication to preserving wildlife, enhancing habitat and conserving the environment.

Wildlife Cover Enhancement

We continually seize opportunities to save and protect wildlife at Bonita Bay. Wildlife and habitat management projects include leaving snag trees, marked as such, providing feeding and housing stations for assorted woodpeckers and osprey.

Straw collected from native pine trees is used to promote favorable plant growth around surrounding landscape trees and plants. Pine Straw is more consistent for golfers to hit balls out of with minimal disturbance to natural areas.

Flowering vines i.e., Confederate jasmine, flame vine, bleeding heart, attract butterflies and hummingbirds.

Cordgrass, a low maintenance lowland and upland shrub used in many non-play areas provides cover for wildlife and houses smaller animals such as rabbits, quail and fox.

The Bay Island course is currently
home to eagles, nesting on site that has been designated as "eagle habitat."

All wetlands on Bay Island are protected. All exotic plants have been removed from the wetlands and replaced with native vegetation.

Water Enhancement includes aquatic vegetation: spike rush, soft rush and pickerelweed, planted in all man-made lakes.

"We feel these varieties provide excellent cover for smaller aquatic wildlife and feeding areas for wading birds like small blue herons and snowy ibis," Black said.

Integrated Pest Management

Black indicated that "Our IPM program is something we are very proud of." Records are meticulously kept by our licensed specialists. The most current and accurate application of IPM products, biological controls, curative treatments along with recognizing pest threshold levels is continuing.

Golf Agronomics meets all your top dressing needs with our ability to customize your mix with a variety of soil amendments including:

**Dolomite • Hi-Cal • Wetting Agents**
**Charcoal • Humic Acid**
**Minor Elements • Rock Phosphate**
**Gypsum • Customer Products.**

Golf Agronomics donates a % of every ton of top dressing sold to the FGCSA. To date, we have donated in excess of $30,000 -- $6,000 in 1997. Thank you to all of our customers!
Pest management is scheduled only if needed. Sites are visually checked, soap flushes and cup-cutters are used to check for insects below the soil surface. A kiddie pool with water under a white light at night, alerts staff to migrating pests and insects.

Parasitic nematodes control mole crickets along lake banks and minimize run-off into lakes. Wildlife that thrives in these conditions help control worms, mole crickets and grubs. Golf course crew members attend seminars to teach them how to identify and control pests.

Our scouting, monitoring and sampling program combined with mapping and charting of all turf pests requiring pesticide control, has enabled us to use pesticides in a most effective and efficient manner. No spray zones have been established around all golf course lakes; most weeds are pulled by hand verses constant spot spray application. "Our IPM team is constantly updating their knowledge about the environment they protect," Black said.

**Water Conservation**

Bonita Bay Club uses a TORO Network 8000 computer to coordinate irrigation of all three golf courses. The system calculates evapotranspiration rates, which convert to a water-as-needed program. "We have more than 5,000 sprinklers on the 54 holes," says Jeff Perbix, golf course irrigation specialist. "We have the flexibility to irrigate many zones, any single station and in any combination we need. Watering is generally done in groups, greens one night, collars the next," says Perbix.

Surveillance and determination of the golf courses' irrigation needs are determined daily. Watering times are adjusted frequently. Each hole is designed with adjustable arc perimeter sprinklers in addition to full-circle fairway heads. "This allows us to water our courses from the outside in and greatly reduce sprinkler overlap into lakes, natural areas and sensitive wetlands," Perbix says. Irrigation water is up to 100 percent reuse, non-potable water, brought in from Bonita Springs Utilities.

The site covers 1,440 acres of sensitive habitat, including woodlands, 900 acres of cypress strands, marshes and improved pasture. Animal residents include whitetail deer, Osceola wild turkeys, Big Cypress fox squirrels, burrowing owls, sandhill cranes and within a few miles, Florida black bear.

**Water Conservation Award**

Residents at Bonita are eligible to receive an annual water conservation award. The annual award is presented by Bonita Bay Properties, Inc., in conjunction with the South Florida Water Management District (SFWMD), recognizing outstanding landscaping that reflects wise use of irrigation water. The natural landscaping thrives with little outside help or water.

To determine the winner each year, Glenn Van Riper, Bonita Bay's director of utilities operations, calculates actual irrigation usage for each homesite. "Bonita Bay maintains a dual water system with two meters per home site. Irrigation water is a blend of reclaimed water and well-field supply, so residents don't even have to be concerned with fertilization," he said.

**Audubon Signature Cooperative Sanctuary**

Matt Taylor is the lead golf course superintendent for Bonita Bay's new off-site golf courses, a non-residential golf facility. The Cypress course, scheduled for construction is expected to start in the fourth quarter of this year. "There is no 'retrofitting' in the Signature program," says Taylor, the man responsible for complying with Audubon criteria. "We are advised on what needs to be accomplished, but the accomplishment is left to the development team's creativity."

The site of the golf club covers 1,440 acres of sensitive habitat, including woodlands, 900 acres of cypress strands, marshes and improved pasture. Animal residents include whitetail deer, Osceola wild turkeys, Big Cypress fox squirrels, burrowing owls, sandhill cranes and within a few miles of the site, Florida black bear.

Players who challenge The Cypress course will also encounter a variety of bird boxes providing additional habitat to feathered forest creatures like Eastern bluebirds, purple martins, owls, etc. Bird box holes are cut for the size of the bird and the nests are monitored "to make sure exotic birds aren't invading," Taylor says.

"We also have screech owl and wood duck boxes. They're all made out of recycled PVC plastics, all painted white to cut down on heat, and they're all strategically placed to encourage the desired species," says Taylor.

How does a golf course superintendent know where to put a bird box? He may not. "That's a really nice part about this program. Audubon representatives don't expect you to do it all by yourself, they encourage you to use outside experts to help," said Taylor.

"An ornithologist, who is part of our
Audubon Resource Advisory Committee, scoured the terrain, identified the species and made recommendations for help enhance bird habitats. “He will assist us with our entire nesting program; all the identification of the species; he’ll give tours for Bonita Bay residents on birdwatching and even set up slide programs.”

“We had cow pastures here that are now golf holes, where pine trees, cypress trees and live oaks have been planted,” Taylor says. “We are recreating pine forest and open pine woods where we have located some of our Eastern bluebird boxes.”

The single challenge Taylor sees in working toward certification is cultivating a mindset in all people.

“At Bonita Bay, it is a priority for everyone,” he said. “While the Audubon program is beneficial in terms of habitat enhancement, it also provides long term benefits and cost savings.”

Recycling had been in effect at Bonita Bay since May of 1994. A significant cost reduction was realized in trash disposal. In real dollars, $7,000 was saved in the first four months of 1995.

The members play an important part of this savings by recycling their Styrofoam cups and aluminum cans in the designated bins while on the course. We have found that 50 percent of Bonita Bay Club’s trash is Styrofoam and 75% of the golf maintenance trash is Styrofoam. We expect similar results at the east courses.

Taylor says,” Audubon helps us direct our efforts toward habitat enhancement and environmental issues. The Cypress course has the same systems in place as the West courses for good reasons. Our attention is focused on preserving our natural habitats, wildlife and on our playing surfaces.”

The architectural design of the Cypress course enhances natural land features. For example, in the improved pasture area, sandy areas became natural waste bunkers. In non-mow, non-maintenance areas, we planted paspalum vaginatum.

“We apply slow release fertilizers that meet Audubon criteria; it’s just good sense. Quick release fertilizers leach too readily and produce inconsistent growth rates.” said Taylor.

**Rewards**

Benefits of responsible stewardship reach beyond cost savings and low maintenance for Bonita Bay. Members, residents and employees alike have joined hands in the spirit of the program by counting bird species, erecting bird houses and feeding stations and avoiding designated areas as no hunt zones. They meet to compare notes of sightings and discuss environmental issues and habitat enhancement.

Residents can be seen walking and

A partnership program benefiting The GCSAA Foundation
biking along nature paths and trails. Encounters may include a rare pileated woodpecker, flocks of water birds, deer, hawks, osprey, screech owls, otters and bobcats that live in harmony with residents. On the golf courses, players report wildlife sightings and enjoy watching bird families. It’s simply part of the game in this community.

Special thanks to Mark Black, CGCS, golf course director, Matt Taylor, Cypress course lead superintendent, Jeff Perbix, irrigation specialist, Glenn Van Riper, director of utilities operations, Marile Barbe', Bonnie Taylor, photographers, Sue Skytta, administrative assistant, for her diligent proof reading and grammar corrections, Mary Jack, Audubon International and Shelly Foy, USGA for their input and support. Audubon is a program that involves many individuals.

Mark Black said, “you must give of yourself and involve others.”
Calculate the pure live seed ratio and save

**DR. A.E. DUDECK**
University of Florida

It is that time of year once again, and in fact, many golf course superintendents may be in the process of overseeding at this time. Overseed discussions quite often are lengthy and varied with few agreements on methodology, timing, choice of overseed grass, as well as rate and method of planting.

Perhaps this short exercise may help to clarify one aspect of the complex overseed process—seed calculations based on the pure live seed (PLS) concept.

Most overseed rates are based on bulk seed per unit area, which certainly vary among grass species. Bulk seeding rates, however, are misleading as variation among cultivars within grass species may vary up to twofold depending on seed number per unit weight along with differences in purity and germination of each seed lot.

In our annual overseed trials at Gainesville, we have seen seed number per bulk pound vary over the years (Table 1).

In our 1996-97 trials, seed number per bulk pound varied from 208,640 to

1 Pounds of bulk seed required per 1000 square feet to produce an average stand of 50 perennial ryegrass seedlings per square inch.

Table 2 Variable bulk seeding rates of perennial ryegrass based on same seed number per unit weight but different quality to effect equal overseed rates based on the pure live seed (PLS) concept.

324,285 for 'Roadrunner' and 'Livonne' perennial ryegrass cultivars, respectively. Similarly, seed number per pound varied from 1.7 to 3.5 million for 'Fuzzy' and 'Pt A' rough bluegrass cultivars, respectively.

Is seed number per pound only of academic interest? Absolutely not!

'Livonne' had a much smaller seed than the 'Roadrunner' cultivar. If both cultivars were overseeded on a putting green at a same bulk rate of 20 pounds per 1000 square feet, seeding with 'Livonne' would have resulted in 2,312,900 more seed per 1000 square feet than the 'Roadrunner' cultivar, which had much larger seed.

The same logic follows if the Poa trivialis cultivars were overseeded at a bulk rate of 5 pounds per 1000 square feet. Because of its smaller seed size, a seeding of 'Pt A' rough bluegrass would have resulted in 8.7 million more seed per 1000 square feet compared to the 'Fuzzy' cultivar of rough bluegrass, which had the larger seed.

If one were to use PLS calculations to overseed a putting green with perennial ryegrass at a calculated rate of 50 PLS per square inch, assuming purity and germination of seed lots were equal, it would require 37.4 bulk pounds of 'Roadrunner' compared to only 24.4 bulk pounds of 'Livonne' perennial ryegrass per 1000 square feet (Table 1).

Likewise, overseeding a putting green with Poa trivialis at a rate of 100 PLS per square inch, would require 9.6 bulk pounds of 'Fuzzy' rough bluegrass to equal only 4.8 bulk pounds of 'Pt A' rough bluegrass. Economic savings should be obvious.

Assuming that agronomic considerations and selling prices per pound are equal, a net savings of 35 and 50% are effected if one chooses to use the smaller seeded perennial ryegrass or rough bluegrass cultivar, respectively.

How does the PLS concept work?
A simple formula using purity and germination is used:

$$\text{PLS}(\%) = \text{Purity}(\%) \times \text{Germination}(\%)$$

Both federal and state seed laws require that all seed lots must have purity and germination information on the seed tag. Unfortunately, seed number per unit weight is not on the seed label. You should request this information from your seed supplier.

Assume that two seed lots of perennial ryegrass have the same number of 240,000 seed per bulk pound (Table 2).
PLS content of Lot 1 is equal to 0.98 (purity) times 0.95 (germination) or 93.1%, while PLS content of Lot 2 is equal to 0.90 (purity) times 0.80 (germination) or 72.0%. Thus, it required 1.1 versus 1.4 bulk pounds of Lot 1 and Lot 2 respectively, to equal one pound PLS. This was calculated as follows:

For Lot 1, $0.931 \times \text{bulk pounds} = 1 \text{ pound PLS}$

For Lot 2, $0.720 \times \text{bulk pounds} = 1 \text{ pound PLS}$

Note that Lot 1 had 21.1% more PLS than Lot 2 which was due to its better purity and germination. Stated another way, it required 1.3 times more seed of Lot 2 to equal PLS content of Lot 1.

What is the bottom line on this? Assuming that both seed lots sold for $3.00 per bulk pound, there would be a net savings of $28.50 per 1000 square feet. When calculated over an average putting green of 5,000 square feet on an 18 hole golf course, a savings of $2,565 is realized by choosing Lot 1 over Lot 2.

Conclusion

Hopefully this little mathematical exercise has convinced you to consider using the PLS concept when buying or selling seed, as well as when calculating rates of seeding. The PLS concept is a little more complicated than presented here, especially as it relates to seed purity, but this is how it works in general.

To be a smart buyer, request from your seed supplier actual seed number per pound along with percent purity and germination, which by law is required on each seed tag of each seed lot.

Step One: Calculate PLS content of the seed lot using the formula: 

$$\% \text{ PLS} = \% \text{ purity} \times \% \text{ germination}.$$ 

Step Two: Calculate the number of bulk pounds to equal one pound of PLS:

$$\text{? bulk pounds of } \% \text{ PLS (from Step 1)} = 1 \text{ pound PLS}$$

Step Three: Calculate the cost of one pound of PLS:

$$\text{Answer in Step Two } \times \text{ price per bulk pound} = \text{Cost of one pound of PLS}.$$ 

These simple steps are something all superintendents should follow when shopping for seed at overseed time. Seed size or number per unit weight is important if one wishes to calculate actual seeding rates per unit area. Suppliers, however, should utilize seed number as well as seed quality in their sales methodology, as they should compare and adjust costs not on a bulk pound basis, but rather on a PLS basis. Everyone should use the PLS concept, because the PLS concept makes a lot of cents.'
Here. There. Everywhere.

How's that for application guidelines?
