Serious new challenges ahead

Pete Dye: Times changing fast

BY MARK LESLIE

Pete Dye, who steps down as president of the American Society of Golf Course Architects during the annual conference in early April, says the major challenge for architects in the years ahead will be dealing with the myriad governmental agencies and regulations.

"With any development project in the United States — whether it's a pipeline or factory or golf course or housing development, the environmental impact is the problem," Pete Dye said.

ASGCA addressing environment issues

Seminars on the environmental challenge, computer-aided golf course design and ground water contamination, and talks by National Golf Foundation and USGA officials will highlight the 43rd annual meeting of the American Society of Golf Course Architects in Pinehurst, N.C., April 1-6.

"First of all, this is definitely the largest conference we have ever had," said ASGCA Executive Secretary Paul Fullmer. "We have 65 members attending, which is 10 more than ever before; and we have 10 applicants still looking for a room."

Hailing breakthroughs in the most recent results of turfgrass research, USGA Executive Committee member Marion Farmer accepted the annual Golf Course Builders of America award on behalf of the USGA Green Section.

Farmer, accepting the plaque at the builders' annual meeting at the International Golf Conference and Show in February, cited the work of researchers that will lead to breakthrough varieties of turfgrass being made available this year.

"It is my firm conviction," Farmer said, "that the USGA in future years will look back on turfgrass research as one of its most important contributions."

NOTES

The number of golfers in Europe reported doubling in 10 years and is expected to double again in the next 10 years, he said, in a testament to the expanding universe of European golf.
Vermont

The board has in effect said by its decision that the project long enough to discourage or abort it because of dwindling bankroll," said Pillsbury.

He pointed to a geological survey demanded by the board at an estimated cost of $35,000. "That's nonsense, totally unnecessary," several geologists have informed the board.

Reginald Hathorn, until recently a Huntington selectman and long in the forefront of Sherman Hollow support, was more vehement.

"Trux was dealt a low blow," declared Hathorn. "If society — read that self-styled environmentalists — is permitted to make autocratic determination of a person's property and inflict financial hardship without comparable responsibility, where will it all end?"

And when one person is threatened in such high-handed manner, all are threatened. Somewhere along the way, individual rights have been sacrificed to 'get the view.'"

"It's becoming much more difficult to gain redress through the courts and judicial system, almost no way short of costly litigation."

Hathorn expanded on what he sees as discrimination against developers.

"About 95 percent of single-family builders proceed undisturbed. Their septic-tanks may be out of whack, but there isn't similar scrutiny, such hawkish surveillance. When objection is raised, it's likely to be on far-fetched grounds."

Hathorn cited a recent home-builder's dilemma. 'Hallway through the building process, a 'Save the View' cry went up. The builder was faced with costly adjournments."

"No self-respecting developer is going to take a second look at Huntington or, for that matter, Vermont, after Trux's harsh experience," Hathorn added.

Sherman Hollow isn't alone. In the Vermont golf course battlefield.

Developers of the Tamarac Golf and Country Club had been pursuing permission to build 435 housing units in Stratton and Jamaica along with an 18-hole golf course and clubhouse.

Rather than being continually confronted by the District 2 Environmental Commission, developers scaled back to 180 housing units, 9 holes, a clubhouse and the smaller part of the 18-hole layout would remain in Jamaica.

Several Vermont golf clubs are concerned about such 'compromise.'

Golf course superintendents, PGA and amateur association officials, course builders and developers have been meeting monthly to create a united front to resist what they feel is a 'divide and conquer' strategy.

Sherman Hollow made this statement: "The decision (to toss the ball back to the community) is very disappointing in light of the continuing position of the board to disallow, ignore or overlook substantial testimony which Sherman Hollow had made part of the record. We feel strongly that, as the process exists, it is impossible to receive fair and equal treatment under the law."

"The decision also appears to set a precedent for many other types of projects, including subdivisions, industrial parks or anywhere turf is used. If equal treatment is applied, it could affect the price of low-cost homes. However, they have the potential to place the cost of golf beyond the average Vermont golfer."

"The board has in effect said by its decision that the way state Environmental Board will make technical decisions independent of the experts in the various state agencies. It also implied that Integrated Pest Management (IPM) can not be approved in Vermont. It is unbelievable that the IPM program, aimed at improving and protecting the environment, would be prevented from happening."

Add Karl H. Deubert, University of Massachusetts professor: "It is unfortunate when the presence or absence of pesticide residues (the original chief board objection to Sherman Hollow) is used as a political weapon. Instant pesticide residue experts take advantage of hysteria caused by the mass media."

A final footnote to Sherman Hollow or, when it rains, it pours.

Because of the lack of snow, the resort never opened in the summer and winter, soil pH appeared to reduce the effectiveness of this organism."

An IPM program sometimes includes judicious use of pesticides. University researchers have conducted pesticide screening trials to identify materials most effective under a variety of conditions and identified proper application techniques for a variety of pests.

useful contributions to the game of golf."

Farmer, of Los Angeles, especially major."

Recently, the governor's most significant — to NuMex Sahara, a seed-propagated ber-mudagrass developed by Dr. Arden Baltensperger of New Mexico State University.

One of the most popular types seeded turf-type bermudagrass in the world, but NuMex Sahara will be made available in August, according to Mike Hills.

Baltensperger's research is one of many turfgrass projects supported by Green Section funds. (NuMex Sahara is available in August, according to Mike Hills.)

Here's a rundown of its meaning and implications:

Integrated Pest Management (IPM) is a relatively new term and tool in golf course terminology. Golf course superintendents may have used IPM practices the past 20-30 years, but such programs weren't titled.

Its suddenly important stature was spotlighted in the recent Vermont struggle between the state Environmental Board and would-be golf course developers.

Home lawn care is addressed, but the regulations apply equally to fairways and greens.

Here's a rundown of its meaning and application from Dr. Richard J. Cooper and Professor Patrick J. Vittum of the University of Massachusetts:

• Turf Integrated Pest Management is an intensive maintenance program that uses cultural, biological and chemical methods to reduce the need for pesticides to control turfgrass pests.

• Time and rate of maintenance applications is most important to improving the health of your lawn and reducing pests before they threaten your turf.

• Healthy turfgrasses not stressed by drought, low fertility, etc., can outgrow pests more vigorously than a nutrient-starved, drought-stressed 'anemic' lawn.

• Raising lawns according to the season by providing a well-balanced diet — and using the lawn mowers — are keys to durable turfgrass lawn with little or no pesticide input.

• Lawn care in the spring will determine how well it will be able to tolerate summer insect and disease activity. Most turf pests are active as the weather warms up and lawns go dormant.

• Disease and insect pest potential are present in every lawn, but they require specific conditions (weak grasses, desir-able weather, etc.) to infest and devastate a lawn.

• One crucial aspect of an IPM program is monitoring the area for pest activity. Normally, a expert is hired to check the area regularly and observe the level of weed, disease and insect activity. The expert then decides whether any corrective action is appropriate. This decision varies, depending on the level of pest infestation, the level of maintenance demanded by the homeowner, and the kinds of action the homeowner is willing to take.

For example, some insect populations cannot be controlled once they reach a certain stage of development, so the only alternative is to provide optimum turf-growing conditions. This will enable the targeted area to tolerate some insect feeding without major effect on its vigor.

A pilot scouting program conducted by the University of Massachusetts in 1986 provided researchers with valuable information about the presence and prevalence of some turf pests and permitted concentration of research efforts.

Turf IPM also includes appropriate watering practices and careful selection of turf species and cultivars.

Some biological control agents that reduce the activity of the Japanese beetle occur in the Northeast. There is a bacte-rium which, when applied to the soil, can kill Japanese beetle grubs. However, some local conditions (soil temperature in the summer and winter, soil pH) appear to reduce the effectiveness of this organism.

An IPM program sometimes includes judicious use of pesticides. University researchers have conducted pesticide screening trials to identify materials most effective under a variety of conditions and identified proper application techniques for a variety of pests.

An IPM program sometimes includes judicious use of pesticides. University researchers have conducted pesticide screening trials to identify materials most effective under a variety of conditions and identified proper application techniques for a variety of pests.

He also reported "a major breakthrough" with development of Zosia grass that has "unbelievable ability to rapid recovery," and resists scarring and injury.

Farmer said the Green Section will play an important role in the continuing growth of golf.

"As you well know, the U.S. is experiencing a tremendous growth in golf course development and demand is not limited to this country anymore. It is also taking place in France, Spain and Italy all have intensive new course development underway... The Green Section has long played an important role in new course development.""Today the Golf Course Builders of America and USGA Green Section have an opportunity to serve the game better than ever before, and on a worldwide basis."

"Golf will not only keep America beauti-ful," he said, referring to the Green Section theme, "but perhaps the world as well."
