Ice, wind and fire

Startling snowstorm buries Midwest
By Peter Blais
The Halloween snowstorm that blanketed the upper Midwest horrified superintendents, forcing many to close courses early and leaving them shaking their heads for failing to blow out irrigation systems or make chemical and fertilizer applications earlier than usual.

Originally forecast to dump less than four to six inches of snow, the early-season storm left 28 inches of the white stuff in Minneapolis and as much as 40 inches farther north near Duluth, Minn., and Superior, Wis. That’s close to half the average yearly snowfall in all three areas.

Southern Minnesota, South Dakota, Iowa, Nebraska, Kansas and Missouri received a mixture of snow and freezing rain, resulting in tree damage, power outages and delayed chemical and fertilizer applications.

"It was the largest single recorded snowfall here in the last 100 years," reported superintendent David Kohlbry of the 37.9 inches deposited on his Donald Ross-designed Northland Country Club in Duluth. Kohlbry was fortunate. He blew out his irrigation system Oct. 1 and was just applying the last snow mold application to the final tee as the snow began falling around 1 p.m. on Oct. 31.

"My major concern was that the ground wasn’t frozen yet," he added. "Snow mold could thrive in that stuff and we could have some real problems, especially on the fairways, next spring." Kohlbry also feared crown dieback from a few hours that brought chaos from which it took a week to recover.

Driving from east to west, the storm hit Maine and Massachusetts, then turned south, pounding the shoreline with 15-foot waves and causing heavier damage than Hurricane Bob, which had struck Aug. 19.

'It was scary," said Brian Cowan, superintendent at Eastward Ho Country Club in Harwich, Mass., on the outer edge of Cape Cod. He described 78 miles-per-hour winds and massive waves that washed 14 cottages and a half-dozen homes into the sea but did little damage to the course.

Hurricane slashes, floods East Coast
By Mark Leslie
Fronted by ferocious winds and coinciding with high tide, Hurricane Grace flew into the East Coast from Maryland to Maine on Oct. 30, leaving some areas looking like a war zone — complete with National Guard troops. Golf courses built for beauty along the coastline paid the price for that location in a frightening:

Runaway blaze terrorizes Oakland area
By Peter Blais
OAKLAND, Calif. — One golf course suffered major damage and several others barely escaped the intense flames that engulfed the hills west of the city in late October.

The 12th green, 14th tee and several fairways at Claremont Country Club were severely burned by falling embers, according to superintendent Randy Gal.

"We turned the irrigation system on in the early afternoon to stop fires from springing up in the more outstanding fairways. It looks like a disease outbreak where the cinders landed. We’ll have to re sod some spots," Gal said.

At least 300 trees along the course and another eight to 10 acres of wildness area belonging to the Jim Smith-designed facility were also destroyed during the blaze, Gal added.

The course closed from Oct. 22-28, re-opening the front nine on the 28th and the back nine a day later. No temporary greens or tees were needed.

Gal’s crew re seeded and re sodded the damaged turf areas and removed 200 trees, including many stately redwoods and cypress, while the course was closed.

"We’ll leave some of the scarred trees in and see what happens. But I expect we’ll lose at least 300," the superintendent said. The cost, mostly labor, to remove burned trees and repair damaged turf could run as much as $200,000, Gal said.

EPA puts pesticide laws in states’ hands
From staff reports
The federal government will soon give more responsibility to the states to manage pesticides that could contaminate ground water.

The Environmental Protection Agency’s recently released Pesticides and Ground Water Strategy gives states a major role tailoring programs to meet local conditions to avoid adverse effects on human health and the environment.

"Current findings do not indicate a public health problem," noted EPA Deputy Administrator Henry Habicht. "However, monitoring studies, including EPA’s National Pesticide Survey of Drinking Water, will continue to receive pesticide and fertilizer use questions for scientists. It's safe to say: We will do more to make sure our programs are as effective as possible.

EPA puts pesticide authority on states' shoulders

Continued from page 1

The strategy document is not a regulatory measure. It describes how EPA intends to regulate some pesticides in the future. If the agency determines that a particular pesticide has or is likely to contaminate vulnerable ground water as a result of normal use, and that labeling and other national-level restrictions do not ensure adequate protection, EPA may require individual State Management Plans as a condition of continued use of that pesticide.

Wells released last November, have shown that pesticide residues are occurring in some public and private wells in various locations across the country.

"While the well-water survey found pesticide residues in only 10 percent of the wells tested, and less than one percent exceeded health levels, the fact that residues are appearing makes it essential to focus on preventive approaches to minimize threats to ground water resources associated with pesticide use."

The strategy document is not a regulatory measure. It describes how EPA intends to regulate some pesticides in the future. If the agency determines that a particular pesticide has or is likely to contaminate vulnerable ground water as a result of normal use, and that labeling and other national-level restrictions do not ensure adequate protection, EPA may require individual State Management Plans as a condition of continued use of that pesticide.

"There are products used on golf courses that have been detected in ground water. Any detected in the future could end up on a restricted-use list. It is possible a restricted-use product could only be applied by a licensed applicator, not a regular member of a maintenance crew."

"That is why it concerns us whether the criteria is potential leachability, detection or actual contamination. If it is just detection or leachability, then we have problems. It could take very little leaching potential to move a product to a restricted-use list."

According to the strategy, State Management Plans would focus on vulnerable areas of the state and may choose from a wide variety of measures including pesticide education for users, modified application practices, use restrictions or prohibitions in specific places, and best management practices to reduce risks of ground water contamination.

"A State Management Plan should reflect the degree of potential risk in a state, which is a function of both the degree to which a problem pesticide is used, and the vulnerability of ground water in the area," Habicht said.

EPA will approve individual state plans and exercise periodic oversight to ensure they are effective.

EPA will also encourage non-regulatory approaches to ground water protection including development of safer chemical and non-chemical pesticide alternatives and transfer of new technologies in partnership with other federal and state agencies.

EPA, the U.S. Department of Agriculture and the U.S. Geological Survey will work together in supplying states with technical assistance and guidance on activities such as data interpretation, monitoring, ground water vulnerability mapping and applying best management practices.

The pesticide strategy was developed with extensive public participation by state agencies, industry, environmental groups and farm organizations.

The general approach of state responsibility for designing individual management plans has broad support, according to EPA officials.

THE AVERAGE GOLFER.

Pink and Gray Snow Mold and Fusarium Patch.

And because CHIPCO® brand 26019 provides long-lasting control, and is registered for use on a wide variety of high-value ornamentals, you can keep more of your course disease-free all season long.

This year, take the bite out of traffic pressure with the proven disease protection of CHIPCO® brand 26019 fungicide. Available in wettable powder and smooth-pouring flowable formulations.

Chipco® 26019 Fungicide

As with any crop protection chemical, always read and follow instructions on the label. CHIPCO is a registered trademark of Rhone-Poulenc. ©1991 Rhone-Poulenc Ag Company.
