HERBICIDES IN RAINWATER

Acrecent U.S. Geological Survey study noted traces of herbicides in rainwater samples from 23 states. Atrazine, alachlor, metalachlor and a degradation product of atrazine were among the sources of the herbicide pollution. To the pesticides found in the rainwater is the atrazine, alachlor, metalachlor and a degradation product of atrazine among the sources of the herbicide pollution. The superintendent of the golf course says it plainly makes sense. International Tennis and Country Club in Fairway, Minn., has contracted with Summit Hall Turf Farm in Poolesville, Md., to grow four acres — that's 170,000 square feet — of bentgrass sod on a U.S. Golf Association-approved soil mix that exactly matches the course's rebuilt greens. This way, all our greens, when we sod them, will have exact matches as far as the mix is concerned. The we're looking for an exact match," said In-...

ternational superintendent Steve Nash.

Nash said he spoke with several superintendents who were "not quite happy with the match of mixes" they had received in their own greens rebuilding programs.

"The mixes were just a little bit off and they were afraid they were getting a layering effect," he said. "This was a guarantee on our part that we will have the exact same stuff..."

Doug Fender, executive director of the American Sod Producers Association, said from his Rolling Meadows, Ill., headquarters: "There have been occasions where contract growing has occurred. But four acres is a considerable operation. In most cases two to four greens (or 10,000 to 20,000 square feet) is all that's involved. And most of it is grown on existing soils. What strikes me in the degree of specification — taking it from the soil on up..."

Nash also couldn't be happier with the speed of the project. Under the oversight of architect Bill Love of Ault, Clark Associates, the greens were torn up on June 10. The perimeters of the greens were sodded with bluegrass from Ray Weekly's nearby Chantilly Turf Farms, Inc., starting Aug. 12. And the sodding is expected to be complete by Sept. 26.

"I'd put it right up there in Ripley's Believe It or Not," said International Tennis and Country Club superintendent Steve Nash.

Frank Wilmot, manager of Summit Hall, said: "The soil mix was sterilized coming in and has gone without herbicides. The idea is to get a good root system. Steve can take care of any weeds once he gets the sod, but it's pretty clean."

"We're mowing at three-eighths inch — just above green height — two to three times a week... and we've been watering about twice a week depending on the weather."

A week before shipments of the sod were to begin, Nash said: "We just cut five pieces. It came up absolutely beautiful. We couldn't have wanted it any better."

Nash also couldn't be happier with the speed of the project. Under the oversight of architect Bill Love of Ault, Clark Associates, the greens were torn up on June 10. The perimeters of the greens were sodded with bluegrass from Ray Weekly's nearby Chantilly Turf Farms, Inc., starting Aug. 12. And the sodding is expected to be complete by Sept. 26.

"One of our objectives was to get it playable as soon as possible," Nash said. "We were pressed for time. We had to hold off in the spring for tournament play on temporary greens and to give members some play. We'll hold off play until the end of next March."

What will happen to the four-acre sod site once all International's sod is hauled away? "We'll take one-quarter to one-half inch of the root system when we harvest the turf," Wilmot said. "We'll probably then work sand into the soil underneath and bring in more sand mix for another harvest."

The first sod is cut from four acres of bentgrass at Summit Hall Turf Farm in Poolesville, Md. "It was beautiful," said International Tennis and Country Club superintendent Steve Nash.

The 30-year-old International greens were rebuilt "because we had no drainage whatsoever," Nash said. "The greens were just pushed-uptop soil. Some were extremely small. Some were small with severe contours that limited our cupping area. We were doing upwards of 50,000 rounds of golf a year and we were wearing the greens out. With no drainage, a storm would soak the greens and, with all those golfers, they would turn to mud."

"To keep up to date with modern golfing play and technology we just had to rebuild."

With **Naiad**, you can keep your turf green and irrigate less because...

The pressure is on. You're expected to conserve water, reduce your irrigation costs and still maintain the lush, spring-green appearance of your golf course.

No, you don't need a miracle — just a Naiad injector system. The Naiad method is the easiest way to quench your turf's thirst and encourage deep root growth. A fully-developed root system is your turf's best defense against disease.

Naiad allows water to easily infiltrate compacted soil structures and other hard-to-wet areas. Your crew can now apply irrigation water without waste. By increasing soil moisture content, your grounds crew will spend a lot less time treating localized dry spots.

**EXTENSIVE PREPARATIONS**

The massive project was started last September when 17 tandem trucks hauled 1,500 tons of soil mix to Summit Hall's farm. (The $40,000 price tag was borne by International, which will probably pay another $60,000 or so for the sod, according to Nash.)

The soil mix was carefully spread at a depth of two inches over a four-acre tract of flat land. The seed was sown in the fall to avoid weed encroachment and to give the bentgrass time to cover the ground by spring.

Frank Wilmot, manager of Summit Hall, said: "The soil mix was sterilized coming in and has gone without herbicides. The idea is to get a good root system. Steve can take care of any weeds once he gets the sod, but it's pretty clean."
