I live and work possibly thousands of miles away from all of you fellow superintendents. But I decided it’s time to relate my experiences and opinions about goose control. This has become a universal problem that you and I deal with daily and, as yet, no one has come up with a solution. To be honest, neither have I, but I am constantly experimenting with methods to manage this problem with the resident Canada goose. Following are all the methods I know of that have been used to chase, scare or eliminate geese from our properties. The list reads in order of least effective to most effective. These are my opinions and I am sure it may cause a stir among us. But here goes:

1. Yelling, waving and flailing arms, throwing rocks.
   
   Result: You look like a maniac.

2. Swinging golf clubs or chasing geese with your golf cart and swinging a club at them.
   
   Result: A nesting goose might bite you. Once again, you’re perceived as a maniac, and the geese get used to your behavior and crap even harder before they honk (laugh) and scoot 5 feet out of the way, only to dump again on another spot.

3. Installing plastic alligators or swans.
   
   Result: The perception is lost — you are a maniac who definitely needs help. Plastic or foam animals placed in ponds doesn’t last long. The geese quickly destroy them while playing their version of Johnnie cross-tackle with them. If you ever get an I-8 eastbound off the Route 59 ramp, you will see a deflated alligator in the corner of the pond. The geese now use him as a diving platform.

Live swans, from personal experience, do nothing to frighten or chase geese off. Continued on page 59

By WILLIAM YANAKAKIS

Canadian geese are back! These words may produce cold chills down the spines of most golf-course superintendents in the Northeast. The once temporary visitors and constant nuisances are becoming permanent residents on our grounds and fairways. They fatten up on our lush turf and leave behind a large amount of excrement. The once temporary visitors and constant nuisances are becoming permanent residents on our grounds and fairways. They fatten up on our lush turf and leave behind a large amount of excrement.

Toys R Us and passed by some residents. The Canada goose is a large bird with brown or gray feathers and yellow feet. They are known for their honking sound and ability to fly great distances.

Once again, you’re perceived as a maniac, only to dump again on another spot. The geese honk (laugh) and scoot 5 feet out of the way, only to dump again on another spot.

Plastic or foam animals placed in ponds doesn’t last long. The geese quickly destroy them while playing their version of Johnnie cross-tackle with them. If you ever get an I-8 eastbound off the Route 59 ramp, you will see a deflated alligator in the corner of the pond. The geese now use him as a diving platform.

A new technique occurred to me while Christmas shopping in early October. I was walking through Toys R Us and passed by some remote control vehicles. A 2-foot boat was on display. After getting some information on price, range and operation I decided to give it a try.

At the course I was greeted once again by about 60 geese just sitting down to dinner. My dog, happily in pursuit, chased them into the pond. I started charging the nickel cadmium battery of my new toy.

Four hours later I hesitantly placed the boat into the pond. As it moved toward the flock, 60 long black necks turned as if in disbelief. I split the flock with my toy boat, then circled the pond. The geese couldn’t leave the little pond fast enough. Amidst much honking and flapping of wings they took flight. My flock was gone.

Since then, smaller flocks have landed, but my grounds crew keeps out-competing the algae. I started charging the nickel cadmium battery of my new toy.

One solution to this problem is to encourage the growth of beneficial microbes by using aeriation equipment. By increasing the pond’s oxygen content, the growth of beneficial aerobic microorganisms is encouraged. This growth consumes nutrients, inhibiting algae blooms. Moreover, the breakdown of dead material at the bottom of the pond is odor-free in the presence of sufficient oxygen.

While aeration alone is often effective, the process can be slow. To give the cleanup process a boost, Enviro-Reps International of Camarillo, Calif., manufactures Super-Bugs, a mix of 11 different bacteria and seven enzymes. Available in dry or liquid form, application of Super-Bugs combats algae growth by consuming nutrients and out-competing algae.

“The enzymes break down the larger waste products, making it easier for the bacteria to further process things,” said Bob Friedman, co-owner of Enviro-Reps. “Because Super-Bugs contains billions of bacteria per gram, they very readily digest the nutrients. When used in conjunction with aeration, they are even more effective.”

Rzadzki airs opinions on Canadian goose control  
Continued from page 40  

of a pond. Yes, they are beautiful birds and may aesthetically enhance a lake, but they dump as much as a goose, they need extra veterinary care, and they need to be fed which attracts other wading birds, which attracts more geese.  

If I could develop a hybrid gator that could survive our winters and could be trained not to eat junior golfers or small adults, I might be on to something.  

4. Flags, tape, and owl balloons.  
Result: Too psychedelic.  

5. Greens covers.  
Results: Finally, something that is very effective in deterring geese on putting surfaces. It’s too bad we can’t leave them out year round.  
But to those who can afford them in the winter time, they work great.  

6. Pond aerator (a reminder — shut them off in the winter).  
Result: If you have bubble aerators on your course, it’s great to keep your stagnant areas moving even in the winter time. But our feathered friends love open water and they will add their own fertilizer down that open hole in the ice.  

7. Irrigation control.  
Result: Quite effective at scar ing geese off of a particular area of your course.  
I have yet to be lucky enough to have a sprinkler head pointing directly at a goose when I turn my heads on. I would really like to get lucky and have one sitting on a head when I detonate. Maybe I would literally scare the life out of him and he would die on the spot.  

My usual result with irrigation control is that geese take off, circle around and land on the next green just as a player is trying to can a 60-footer.  

8. Shellcrackers and rockets.  
Result: I personally have not used this tactic, but I have talked to others who have. Once you gain permission from your neighbors to use these devices (if you can), I have heard they can be very effective — if you are persistent and use them before play begins.  

Result: They work. I have personally seen them used to protect various wetland management crops until they are large enough to withstand a feeding frenzy from the honkers. I understand the goose grid is a temporary barrier installed for the protection of wetland crops until they mature. But during that time they look quite unpleasant, especially when the water level goes down and the algae hangs off the strings. It takes a silver-tongued superintendent to explain the benefits of this ugly situation to his committee — and it will remain that way for a few years.  

10. Vegetative buffer zones around lakes.  
Result: According to many wildlife biologists, including those at The Audubon Cooperative Sanctuary System, this is one of the best ways to keep geese on the water and prevent them from walking onto the turf. I have yet to hear of anyone having any positive results from this management practice. If any of you have, please call me.  
I believe the theory is great, but to put it into practice is rather difficult on a golf course. Most of our club’s committees demand that “clean-cut look” on lake banks. Once again, to convince them this method will work is very difficult, especially when they pose the question, “Can’t the geese just fly onto our turf?”  

Dahhh!  
I was able to persuade upper management here not to mow our lake banks this past season. One positive point: It reduces labor costs and time. Next season I hope to extend the buffer zone further up the bank. Then I will be able to see for myself if this management practice really reduces goose fertilization on my fairways, greens and tees.  

11. Grape juice/Reject it.  
Result: In my opinion, the jury is still out and the scientists, I am sure, are feverishly working to discover if this will work. Millions of dollars are at stake. If it fails I’ll just add some ice cubes and have a cold drink.  

Result: Removal and/or spraying with some sort of oil-based product is very effective, but very illegal. $500 per egg if you’re caught molesting a federally protected bird. Egg-shaking is legal but difficult.  

13. Remington’s cure.  
Result: Very effective. A 12-gauge shotgun can solve many problems and create many as well. I don’t believe the “nuisance season” for removing geese is available in Illinois at this time. I didn’t give it much regard since we did not want to start any problems with our neighbors. I am sure that many of you would share this same concern.

EVERY MORNING, THERE ARE TWO THINGS YOU CAN COUNT ON: THE SUN WILL COME UP. YOUR CARRYALL WILL GO TO WORK. THAT’S RELIABILITY. [ACCORDING TO A RECENT SURVEY OF GOLF COURSE SUPERINTENDENTS, THE CARRYALL BY CLUB CAR IS THE MOST RELIABLE LIGHTWEIGHT TURF UTILITY VEHICLE ON THE MARKET.] AND NOW THAT OUR CARRYALL II PLUS HAS A NEW, MORE POWERFUL 11-HP, 4-CYCLE ENGINE, IT CAN ONLY GET BETTER. FOR PERFORMANCE, SERVICE, AND SUPPORT, RELY ON CARRYALL. CALL 1-800-643-1010 AND DRIVE IT TO WORK.
