Best site, ecologically and financially, equals best results for bank

By MARK LESLIE

Experts have learned much in recent years about constructing wetlands, yet the site can still "make or break you," they say. "The Corps [of Engineers] in the Norfolk, Va., district cites a cost of $20,000 an acre to create wetlands," said Williamsburg Environmental Group Vice President Mike Kelly of Williamsburg, Va. "But it’s very site-specific. If you have a wrong site it could cost $50,000 to $100,000. And if you pick the right site — say, prior converted cropland field — you can create wetlands for 3%,000, 00 per acre.

Positive attributes include hydrology, plant species and soil conditions, Kelly said. "What it comes down to," said former Environmental Protection Agency controller Dave Ryan of Reston, Va., "is you have to look at demand, the regulatory agencies you’re dealing with, and the science. Whatever you have to do to make a property a workable wetland.”

"The site could make or break you — that and the economics of property in the area.”

Mike Horton, of the California Department of Fish and Wildlife, said construction of vernal pools are particularly tricky, and important, since so many have been lost to development over the years. Vernal pools are very delicate, specific wetland ecosystems.

"We’re particularly looking at acquisition banks ... because we recently have some vernal pool species listed [as endangered],” Horton said. "One of the biggest problems we have is that it is unclear whether created vernal pools will actually function and what regulatory safeguards we need. And what we need is long-term. Most have taken a million years to develop. The oldest we’ve created are 5 to 8 years old. Some are failing and some are not. But we don’t know if they are going to survive another 10, 20 years or 1,000 years.

Saying the difference between survival and failure of these vernal pools usually is in "methodology of construction,” he added: "We’ve learned a lot in how to construct them over the last five years.”

Yet Steve Johnson, director of conservation science for the Nature Conservancy’s San Francisco office, warned of dangers in trying to be of more assistance to the public. "The Army Corps of Engineers’ Herald Jones, who is involved on a national task force to draft the regulations and who helped draft a wetlands bank agreement for the city of Virginia Beach, Ga., said some rules are certain. "We will initially look at all opportunities for on-site mitigation," Jones said. "If that is not possible, we would go to nearby or adjacent properties. In-system [in that particular watershed] mitigation would be the next level down. If opportunities are not available or not practical, we would look at out-of-system mitigation.

"Frankly, that sequence of events ... must be completely fulfilled before going to a mitigation bank.”

Environmentalists concerned about ease of approvals

By MARK LESLIE

Some environmentalists are concerned that the mere existence of wetland banks will slow down the permitting process, while others give tepid support and still others see them as a great improvement. "There is some concern that we will make it too easy,” acknowledged Mike Horton, who authored a mitigation bank policy for northern California for the state Department of Fish and Wildlife. "The initial response from some groups has been fairly negative. However, the groups that have been willing to work with us on this have started to see its potential.”

"Certainly one of the benefits from the regulatory end is, it does provide a faster review of mitigation options,” said Her-ald Jones, chief of the Southern Virginia Regulatory Section of the Army Corps of Engineers’ Norfolk District. "But because a bank is in place, that does not vacate the requirements of sequential approach of avoidance, minimization and, finally, compensatory mitigation. Those are federal regulatory requirements [under Section 404] that must be fulfilled.”

Steve Johnson, director of conserva-
tion science for Nature Conservancy’s San Francisco office, warned of dangers with creation banks while supporting "res-
toration" of former wetland areas. "Mitigation is absolutely necessary as a way to manage the impacts of life in the modern world,” said Johnson, whose group has performed numerous mitigation trans-
actions and has contracted with the Army Corps of Engineers to identify, acquire and restore sites along the Sacramento River. "But creation of habitat as a mitigation strategy is very dependent on the ecosys-
tem that is being impacted. Sometimes it's possible and sometimes it's probably not. Mitigation strategies need to acknowledge that not all ecosystems are created equal.”
