Weather stations join space, subterranean ages

By MARK LESLIE

Data Transmission Network Corp.'s (DTN) purchase of Broadcast Partners and Golf-Links in May underscores the rising stock of weather stations — in the world general, and on golf courses in particular. "The golf superintendent has taken a quantum leap in the last five years in evaluating the value of weather information," said Peter Levy of WeatherMetrics in Lenexa, Kan.

While many green committees might say, "It's just another toy," weather stations can save more money than they cost — in terms of using less water, fertilizer and chemicals, and using them at the right time. The idea of weather stations has been that of a superintendent feeding information into a computer that of a superintendent feeding information back to the office.

"I think having weather information in your hands to make decisions is going to be a bigger factor down the road," said Jerry Lemons, a superintendent and golf course designer in Hermitage, Tenn., who developed GolfLink, a weather, lightning and golf information service tied into satellites. "The regulations on how we apply pesticides and fertilizers are going to become a little more critical as time passes. If we have a better handle on the weather forecast in a period when we want to make an application, then we can manage it better."

"You can really fine-tune your scouting and your irrigation," said Dan Dinelli, superintendent at North Shore Country Club in Glenview, Ill., who owns the Australian-made Metos system. "It's slick. Not only does it provide raw weather data updated constantly (not once a day), but it has disease models for pythium blight, brown patch and dollar spot. It graphs the severity of the disease pressure. It also tracks degree days, which is a great help for emerging weeds..."

"We try to give the superintendent a variety of information that he can customize for his specific course," Levy said. "Most systems give them one ET rate, and they have to figure in what they have on the tees, roughs, fairways and greens. By the time they apply all the different factors it's such a pain that we can make a decision: 'Do I spray today or not?'

"But suppose a superintendent doesn't have time to make a decision. They have the weather information, and they have to figure in what they have on the tees, roughs, fairways and greens. By the time they apply all the different factors it's such a pain that they can't make a decision: 'Do I spray today or not?'"

By the time they apply all the different factors it's such a pain that they can't make a decision: 'Do I spray today or not?'"

The new breed of weather station goes beyond the basic irrigation concerns, and it is gaining enthusiasm among the ranks of superintendents. "That's pretty incredible," said Country Club of the Rockies superintendent Kevin Ross of the WeatherMetrics station's five different ET rates. Those rates are calculated according to type of grass, height of cut and other factors. "Plus it has many soil-temperature probes in the field that register back to the office. It costs $10,000, but it's absolutely worth it."

The $6,000 cost of the Metos system, Dinelli said, "can be realized in savings in one day. One of our pythium applications, for example, can be as high as $6,000. We can use a scientifically developed disease model and be able to more accurately say whether the disease pressure merits spraying. In the past our gut feeling may have pushed us to spray. Now, this tool can tell us [information like] it needs to get 5 degrees warmer, or it needs to get 3 degrees hotter for another three hours."

WEATHER STATIONS

By MARK LESLIE

While weather stations today are light-years ahead of the past, great advances are still expected in the future.

Having completed its purchase of Broadcast Partners, DTN has already invested in turf-related developments and has hired a turfgrass expert to manage the golf end of that research, according to DTN Director of Public Relations Eric Miller.

"We want to be able to use short-wave frequencies and download the information right into the computer rather than use a modem," said John Gebr, a salesman for Spectrum Technologies, Inc., which distributes the Davis station but with Spectrum ET software.

"We've tried to design a system that's adaptable for the future in case a superintendent wants to add soil moisture, soil temperature, water temperature, water temperature monitoring," said Peter Levy of Weather Metrics in Shawnee Mission, Kan.

"Considerable work is still needed to establish historical databases for weather data and to accumulate field observations that relate to it," said superintendent Dan Dinelli of North Shore Country Club in Glenview, Ill.

"More disease models must be constructed. Degree-day models need to be calculated for other pests as well as for beneficial insects. There is a lot of room for home-grown research, based on collected data, coupled with field observations.

"We are looking at soil temperature readings to help fine-tune the timing of green cover applications, day length and how it may affect plant responses, solar thermal units to further refine degree units, and soil temperature versus root growth. The uses and applications are limited to your imagination — that's what makes this tool so exciting."

Levy adds his own vision — that of using, say, four sensors at different spots on every green to monitor such factors as moisture and pH content.

Beyond that? How about using the Smart Sensor, an available technology, for turf?

"Just think," Levy said, "a little chip that can make decisions. You can put one on every sprinkler head on the golf course and wire it back into the office. You could monitor different parameters at every sprinkler head. These sensors are getting smaller and smaller."

"The value of water, etc. is much more than, say, 20 years ago. The market will dictate when the Smart Sensor and other new technologies come along. We all can see that if we had four sensors at every green giving constant feedback, it would help protect a $30,000 to $40,000 asset."

Weather stations gaining favor

Continued from page 31

They don't do it. With five ET rates, they can input up to five different grasses and five mowing heights. It is continually calculated every second, while most systems take an average reading for the day."

Donelli is also enthusiastic about the new record-keeping abilities of weather stations and Metos' use of sensors.

"The station has 10 sensors: a thermometer for air temperature 5 inches above the turf and one for soil temperature 2 inches below the turf; a rain gauge; two leaf-wetness sensors; a soil moisture/sensor; a solarimeter to record solar radiation; a temperature probe two inches deep.

"Soil temperature and moisture largely govern microbial activity as well as the nutrient release by some fertilizer carriers."

"And insect development relies on many of the factors tracked by weather stations."

The record-keeping element of weather stations can be a job-saver as well as a help in court (see sidebar), Donelli added.

"We don't have time to go out every 12 minutes and document air and soil temperature, moisture, etc., like the station does," he said. "So it comes in handy, especially in extreme weather conditions. We can enter the software and pull out historic weather data to demonstrate any goings-on that may be in question,

"For example, we had a record-breaking hot, humid summer last year. We were able to document, with tremendous accuracy, what the soil temperatures were, which reflects why the turf was under such stress."

"You post that information on bulletin boards around the clubhouse, along with a brief article that explains heat stress, and people (golfers) start to understand the problems involved."

All "detection" systems tell you a bolt just struck.

THOR GUARD, the world's only true lightning prediction system, continually monitors and scientifically evaluates the invisible electrostatic atmosphere that creates lightning within your predetermined area of concern.

THOR GUARD is so accurate that it warns from a storm's early stages through its most violent, then issues an all-clear when the danger has passed. It even warns of the deadly "Bolt Out of the Blue" lightning which can unexpectedly strike on a perfectly clear day.

THOR GUARD eliminates the risk inherent in conventional detection/tracking systems, which report lightning only after it strikes... or "guesses" your danger on the basis of lightning strikes miles away. THOR GUARD's computer determines with certainty that your property is safe even when lightning appears in the distance...permitting uninterrupted play and profits!

THOR GUARD is so accurate that it warns from a storm's early stages through its most violent, then issues an all-clear when the danger has passed. It even warns of the deadly "Bolt Out of the Blue" lightning which can unexpectedly strike on a perfectly clear day.

New Juice Drive Trim Mower

- Low initial cost — much less than a competitive trim mower
- 1/2" height of cut with full floating cutting heads
- Out front triple with rear wheel steering
- Hydraulic drive to the wheels
- Hydraulic lift for the mowers
- National simplicity in a hydraulic drive trim mower

For details call: (612) 646-4079

---

Nothing makes a golf course look better than a National. The Best Price. The Best Cutting.
