EDMONTON, Alberta, Canada — Two environmental initiatives have received a big boost thanks to a $110,000 donation from the Royal Canadian Golf Association (RCGA).

A check for $75,000 was presented to the Canadian Turfgrass Research Foundation while the Audubon Cooperative Sanctuary System of Canada received $35,000 during the RCGA's annual general meeting here at Edmonton's Fantasyland Hotel.

"The sport of golf has enjoyed incredible growth in recent years," said Stephen Ross, executive director of the RCGA. "However, that growth places increased importance on developing the game in an environmentally responsible manner. Both these programs work hard to protect and enhance our environment and we are proud to support them."

The Canadian Turfgrass Research Foundation (CTRF) funds turfgrass and environmental research at various universities. The foundation's goal is to reduce maintenance requirements by improving turfgrass species and cultural practices. Institutions currently receiving CTRF support are Laval University, University of Guelph and Nova Scotia Agricultural College.

ACSS OF CANADA

The Audubon Cooperative Sanctuary System of Canada develops and administers environmental education programs for landowners. As many as 25 Canadian golf courses have become fully certified sanctuaries for wildlife, while another 170 courses are actively participating in the program. The RCGA's donation will assist in the ongoing environmental education program.

Ice damage

to clean up in the spring."

At a price of $16 for a 40-pound bag of Profile and $8 a bag for a 50-pound bag of sunflower seeds, the material costs are low.

Superintendent Scott Cybulski at Falmouth Country Club is having similar success with Profile. He uses one 40-pound bag per green and has made one application so far this year.

"It works right down through the ice and makes air holes in it," he said. "When it is above freezing it works really well. It turns the ice into a frozen margarita consistency."

While some are concerned that constant applications of Profile would cause the build up of a Profile "layer" in the soil, Hodge is not concerned.

"I am putting down such a light application," he said. "And with my verticutting and aerification it gets worked into the soil. I have also just done this twice this year. If I was putting down tons year after year, then I would worry."

Getting rid of the snow cover and the ice, however, does open the greens up to other problems, Hodge conceded.

"Exposed turfgrass is now susceptible to direct low temperature kill and desiccation," he said. "But at least I can see the turf and manage it."

The best case scenario at this point would be snowy weather.

"We have had a lot of ice this winter," he said. "Some snow cover would help."
