Labor Day has come and gone but hard work still remains

Most superintendents look forward to Labor Day because it signals the unofficial end of the summer season. As throngs of golfers begin to thin out and hot weather moderates, the pressure on superintendents usually begins to ease. All that's left to do is concentrate on fall clean-up work.

However, due to the drought conditions that plagued much of the United States this summer, many superintendents are facing the arduous task of preparing already stressed turfgrass for winter. For courses in drought-affected areas that stay open year-round, it will be even tougher to maintain playable conditions.

In this month's issue, Kathy Antaya, an agronomist with the United States Golf Association's Green Section, walks us through the difficulties of repairing turf damage while still obeying water restrictions (see page 7). Her message is clear: courses will have to use alternative cultivation strategies to minimize damage and maximize recovery. Superintendents will have to accept more delicately, seed more vigorously and apply fertilizer more regularly. More aggressive turf renovation practices will likely have to wait until spring.

This means golfers will have to learn to live with damaged areas and less-than-perfect playing conditions and superintendents will, as usual, bear the brunt of their complaints. Frustration levels are already running high as helpless superintendents realize their untenable situation. "If we could have done something to solve the problem, I would have done it by now," an exasperated superintendent said to me about his inability to minimize the impact drought was having on his course.

Since these conditions do not lead to high job retention rates, it is now more critical than ever to explain specific drought-related difficulties to course officials and golfers. Superintendents need to take the time to communicate and let golfers know what impact the drought is having on the course, standing. As Antaya puts it in her article, "compromise will be key."

As you may have already noticed, Golf Course News has an updated design. While the sections and monthly features remain the same, we have changed our typefaces and improved the layout to make news and information more visible, readable and accessible. The last six months here at GCN have been busy as we have added to and readjusted our editorial content.

Single-year renovation plans provide more advantages

by JEFFREY D. BRAUER

Your parents and grandparents probably gave you much advice, such as warning you about the problems of excessive debt. Remembering the depression, they were financially conservative. However, they also told you, "If it's worth doing, it's worth doing right." The kids of the 1980s and 90s tend to have the same, we have changed our typefaces and improved the layout to make news and information more visible, readable and accessible.

Multi-year renovation plans maximize financial resources

by BOB LOHMANN

When enacting a renovation plan, should courses bite the bullet and suffer the slings and arrows of revenue streams gone completely dry? Or should they spread the work over a few years, thereby testing the patience and loyalty of golfers who are obliged to play temporary greens in the company of bulldozers and sod-cutters?

These are the questions facing course owners who live and die by how, and how well, these questions are answered. It is the job of the architect to help them make the best-informed, most practical decision possible.

At Lohmann Golf Designs, we've done dozens of renovation jobs where the course was closed down completely, remodeled and reopened the next playing season. We've executed dozens more of the installment plan. And while the architect himself is often better served by shutting a course down and completing renovations in one fell swoop, oftentimes the client is best served by spreading out renovation/restoration work over several playing seasons. Why? The answer is simple and predictable: money. It's difficult to come up with the $2 million to $5 million needed to overhaul an entire 18-hole golf course these days. For a majority of operators, that kind of money isn't always available — not all at once. It is the architect's responsibility to maximize a client's available cash, which often means creatively planning, staging and executing renovations over two or three years, sometimes longer.

My firm just broke ground on the renovation of Randall Oaks Golf Course, a municipal facility in Dundee, Ill. We've been working with the course doing small bits of our master plan, since 1986. Last year,
