Scotts ready to round up GMO turfgrasses
BY A. OVERBECK
MARYSVILLE, Ohio — With clearance from the Oregon Department of Agriculture to grow Roundup Ready creeping bentgrass in a special control area, the Scotts Co. is one step closer to bringing the first of many genetically altered turfgrass varieties to market.

Management companies increase marketing focus
BY DEREK RICE
Faced with flat rounds numbers and increased competition in many markets, management companies, many for the first time, are needing to rethink the way they sell and market their properties.

BUILDING A GOLF DESTINATION
With construction of the Tom Weiskopf-designed Falls Course, Lake Las Vegas Resort, a $4 billion development south of Las Vegas, is looking to become a major destination for golf in the Southwest. The resort already boasts two Jack Nicklaus-designed courses and may add as many as three more courses in coming years. See story on page 11.

P.B. Dye builds $1.5M Buck's Point GC
BY A. OVERBECK
LIBERTY, Ind. — After eight years of work, P.B. Dye is set to open his own golf course here on the shores of Brookville Lake in eastern Indiana.

The First Green of Wash. gets off the ground
BY ANDREW OVERBECK
SPOKANE, Wash. — A grassroots educational effort aimed at introducing high school agriculture students to the golf industry is starting to pay dividends here in Washington State.

POINT
Bill Rose of Turf-Seed squares off with Don Suttner of Monsanto and Bob Harriman of Scotts on Roundup Ready turgrass fields in Oregon.

COUNTERPOINT
Roundup Ready control area aims to prevent contamination  

By ANDREW OVERBECK

MADRAS, Ore. — The Scotts Co., Monsanto and the Oregon Department of Agriculture (ODA) have established an 11,000-acre control area for the production of Roundup Ready creeping bentgrass to protect against the danger of cross-pollination with conventionally creeping bentgrass.

Four hundred acres of the genetically altered turfgrass will be planted this fall in Jefferson County, which is more than 110 miles away from the country’s primary bentgrass production region in Oregon’s Willamette Valley.

“We feel really good about the safeguards that have been put in place that will protect conventional production,” said ODA spokesman Bruce Pakenney. “The whole point was to tighten down any possibility of cross-pollination of conventional bentgrass, which is grown exclusively, at this time, more than 100 miles away on the other side of a major mountain range.”

Dr. Kevin Turner, director of seed research and production for the Scotts Co., will oversee the control area.

“We started working with the state of Oregon 14 months ago, making presentations on this technology and our projects,” he said. “One of the things that came out of the concern over outcrossing into other species and agrostis varieties. However, studies show that the levels of outcrossing are very, very low.”

As a result of the concerns, however, Turner worked with the ODA to create the control area guidelines to insure against any contamination (see box).

CONVENTIONAL BENTGRASS CANNOT BE GROWN LESS THAN A quarter mile from the Roundup Ready creeping bentgrass.

• Conventional bentgrass fields will be hand-weeded for 165 feet on the outside of the bentgrass fields to prevent outcrossing.

• A seed-cleaning plant will be located within the area.

• The plant will only clean Roundup Ready creeping bentgrass.

• Seed will be harvested with a dedicated combine.

• Seed will be put into sealed containers for transport from the field to the cleaning plant.

• Processed seed will not leave control area except in sealed commercial containers.

• The seed will be distributed directly to golf courses from the control area.

• Straw containing the seed will be burned.

• Any leftover stands of turf will be watered to promote growth and then killed with a herbicide and shallow tilled.

• The next crop planted in the field will have to be one that can be sprayed with a herbicide that is effective on Roundup Ready creeping bentgrass.

• Fields will be rotated every three to four years.

Once approved, Roundup Ready creeping bentgrass will first be available as a fairway turfgrass variety. Data is still being collected on its ability to function on greens, but a greens-specific variety will be released in the next two to three years, said Harriman. The fairway variety can be sprayed with Roundup at 32-ounce per acre rates.

Wayne Horman, director of seed sales and marketing, estimates the initial market for Roundup Ready creeping bentgrass at 2,000 to 3,000 courses.

“While taking greens out of play to convert them is not the easiest thing to do, fairway conversions to eliminate gray leaf spot concerns are the target markets,” he added. “I am sure it will be resolved when it comes out and we’ll be fine.”

GMO turf moving closer to reality  

Continued from page 1

being produced with Roundup Ready technology,” said Dr. Kevin Turner, director of seed research and production for Scotts. “It seemed like the most appropriate first project. The next step was deciding which species should be our target. Helping golf course superintendents take care of Poa annua in bentgrass was the obvious project to work on.”

Developing Roundup Ready creeping bentgrass, however, was relatively easy because it involved altering just one gene. Inserting drought tolerance or disease resistance will be more complicated and expensive because it will likely involve altering multiple genes.

“Biotechnology is in the Model-T phase,” said Harriman. “The Roundup Ready gene can be proved very quickly, but developing disease resistance is much harder and will take longer.”

Looking to the future, Harriman said developing disease, insect and drought resistant turfgrass is the ultimate goal.

“If we think about the stresses that lead to decline and how we can change that, the possibilities from a performance and aesthetic standpoint and a cost reduction standpoint are impressive,” he said.

While the goal of Roundup Ready creeping bentgrass and other genetically altered varieties are to make the superintendent’s job easier, it will not replace agronomic knowledge.

“We will have dedicated seed cleaning and equipment, and will monitor the production fields,” Turner said. “We have a multi-faceted plan to manage the fields and prevent outcrossing.”

As a further control measure, growers will have 10 percent of their pay held in an interest-bearing escrow account until May 31 following their last harvest to guarantee that the crop has been properly removed and planted in the prescribed manner.

“The stewardship program is much more demanding than any program I know of anywhere,” said Ron Olson, the managing director of grower cooperative New Era Seed that has been set up to produce seed in the control area. “The performance bond is a good thing because it makes growers comply with all the stewardship requirements and quality specifications that need to be addressed.”

OBJECTIONS OVER SAFETY

Bill Rose, president of Tee2Green and primary detractor of the Roundup Ready control area, is still not satisfied with the stewardship measures.

“I can easily predict distortions and open pollination,” Rose said. “As a result of this control area I expect to see genetically-altered turfgrass banned in the United States. My goal is to try to get it banned.”

While he views the ODA’s decision to allow the control area as a setback, Rose is still pressing forward with his own plan to develop herbicide resistant turfgrass that is male sterile. Rose said sterility could be demonstrated as early as the end of this summer. From there, commercial production of the seed could occur within three years.

IGM lawsuit

Continued from page 3

In the Battleground lawsuit, IGM has filed suit against the club for payment of $300,000 in maintenance fees that it has yet to receive.

Club officials and lawyers for both sides declined to comment, but that case is headed for mediation and could be decided as early as the end of August.

As for the other New Jersey contracts IGM lost last year, maintenance at Glenwood CC in Old Bridge was taken over by Environmental Golf, and maintenance at Bear Brook GC in Newton was brought back in house by new owners Gale and Kitson.

“No one likes to lose anything,” Zaky said. “But when someone under bids you trying to get business, or someone sells a course, or someone owes you a substantial amount of money, those are difficult business decisions. But they have to be made in terms of what’s best for the company.”

“Emerson was the only course we lost because of maintenance conditions,” he added. “I am sure it will be resolved when it comes out and we’ll be fine.”
