Creative Award Breakdown

**BUILDER:** Landscapes Unlimited

**PROJECT:** The Prairie Club, Valentine, Neb.

**COST:** $5.8 million

**TERM:** May 12, 2008 to May 31, 2010

**ARCHITECT:** Graham Marsh (The Pines Course), Tom Lehman and Chris Brands (The Dunes Course)

**SUPERINTENDENT:** Ross Buckendahl

**NOTABLE NOTES:** Overcame location, staffing and timetable challenges to produce two world-class courses.

Lucky for him, however, his company was familiar with the H2B temporary worker program, where companies can secure workers from Mexico who are then allowed to work in the U.S. for eight months, then must go home for the remaining four months. Landscapes Unlimited has had as many as 450 H2B workers at one time, and for its Sutton Bay project in South Dakota used 40 workers for construction and 18 for existing maintenance.

"It has been a godsend to have these workers from Mexico that we're so dependent on for the projects that we can get certified for H2B," Kubly says. "It's not doable for a lot of projects because the unemployment rate is so high, the government won't allow us to bring these workers in and makes us use local labor instead."

Club management was educated in all aspects of the H2B program including labor certification, employee recruitment and program compliance requirements. H2B employees interested in accepting employment as maintenance staff were assigned to project construction crews. This resulted in a "built-in" recruitment pool from which the superintendent would select and hire maintenance staff.

"The continuity created by transferring construction

Landscapes Unlimited used the natural resources of the Dunes Course to create a links-style course in comparison to the Pines Course.
The remoteness of the site also provided some challenges as far as getting power to the site. Three-phase power was not available for the wells and pump station to meet the grassing timeframe, so generators were used during the maturation and grow-in of the courses until the town of Valentine was able to bring in three-phase power.

"This required daily maintenance and operation of this critical component," Kubly says.

High winds also didn't make for a picnic on this extensive and fast-paced project.

"When you're building things out of pure sand, the wind can come up and destroy what you've done that day, but mainly when it comes to grassing the course, there are a lot of days when it's so windy, if you try to seed it just blows all over the place," says Kubly. "If you're trying to plant different types of grasses on greens, for instance, you may have to wait two to three to four days before you can actually plant that seed. There's a lot of wind erosion."

Kubly says they didn't use much hydroseeding or erosion blankets to combat the problem. As far as the blankets are concerned, he says the site was so vast they wouldn't have known where to start and stop them.

"The key was keeping the ground wet once you had the seed down, and then you probably had a six- to 10-day window to get the seed sprouted to hold the sand itself," he says. "On most courses, you would have only had the potential for that problem on the greens, but in this case, the whole course was built the same way. The same sand material that was in the greens and bunkers was also in the fairways and rough."

The wind also created problems with the irrigation system, says Rob Christie, who worked as construction superintendent on the site.

"The wind blew a lot of sand in the irrigation pond, and it was so fine that it got into the irrigation system and caused some heads to stick on," says Christie.
Christie says the number-one problem in his opinion was clearing the prairie grass on the Dunes Course.

"Usually when you're shaping in you're destroying everything and coming back with clean dirt, but we weren't doing a lot of shaping," he says. "We were originally going to seed right into it but it just wasn't seedable. The root system was pretty intense, and when we went in there to till it up, it just brought up the roots so it turned into quite an ordeal."

Weather can often be a nemesis of a golf course construction project, causing massive delays. But that was at least one challenge those involved with The Prairie Club project were able to avoid. It's for that reason that Christie would not classify the project as one of the hardest he has worked on.

"Every project seems to have its own unique challenges," says Christie, "but on this one we didn't have a lot of rain days or weather challenges. We had a couple thunderstorms but that was it. On our end, everything went pretty smoothly."

As far as difficulty, Kubly ranks Prairie Club in the top 10 percent of the 400 to 500 courses Landscapes Unlimited has built. But he says there were aspects of it that were easy, too.

"As difficult as parts of the job were, a lot of it was simpler," he says. "For example, we had none of the bureaucracy that you would encounter in some major U.S. cities in regard to wetland and erosion control. Since we were in the middle of nowhere, there were not nearly as many regulations."

One of the unique aspects of the project in Kubly's mind was the fact that it proved people are still spending money to develop remote golf courses even in tough economic times.

"At a time like this, people wonder how could a course work economically," he says. "But this developer had the guts to do it and proved, by picking two top architects, that he has a project out there that is very successful. It puts little old Nebraska on the map as a great place for golf, and when you look at the three world-class courses there now in Sand Hills, Dismal River and now Prairie Club, who would ever have thought it would become one of the top golf meccas in the world?"

Accolades the course has already gotten include "Best New Course" in the world and "Overnight Destination of the Year" by Golf Digest, "Best New Courses of 2010" for the Dunes Course (#2) and "Best New Courses of 2010" for the Pines Course (#8) by Golf Magazine, and "Top 10 New Golf Destinations in the World" by Links magazine.

If those honors didn't get golfers' attention, then certainly the publicity campaign that owner Paul Schock spearheaded did.

In addition to creating a Facebook page and posting a viral video on YouTube, the campaign netted more than 85 articles which generated more than 25.6 million impressions among serious golfers worldwide.

---

After Hurricane Katrina struck the Louisiana coast in 2005, the Joe M. Bartholomew, Sr. Golf Course was left devastated. Much of the most historically significant golf course in Louisiana was underwater for more than eight weeks. We at Duininck Golf were given the opportunity to be a part of the revival of this great course and now we've been given 2011 Heritage Award for that work. We are extremely thankful for both.
Garbage. Slag. Industrial waste. These are generally not the kinds of things you find on a golf course. Nor do you find drug dealers and prostitutes roaming about. But they were all present at the site of The Golf Club at Harbor Shores before it became a golf course so impressive it was named to host the 2012 and 2014 U.S. Senior PGA Championship.

"I would say that this was one of the greatest achievements of my life – next to the birth of my little girl," says E. Randal Pichan, president of Eagle Golf Construction.

Consider the challenges Pichan and his team faced: clean-up and restoration of the 540-acre "Brownfield Site," remediating poor soil conditions, dealing with permit and approval delays, working around endangered dunes plants, constructing a 13-mile piping system to collect the site’s drainage run-off and fighting off a park preservation society that opposed the project.

Even though a park on the site had become a haven for pushers, some folks felt that it had historical significance given that it had been donated by an important local family in the early 1900s. Ultimately, golf won out and the parking lot became one of the course’s holes. But Bob McFeeter of Evergreen Development Company restored the old park to an exact replica of what it used to be, and people started coming back to it.

Pichan recalls one elderly man he talked to who appeared lost while visiting the site.

"He said that he had been hearing about the project and that he and his wife had frequented the park back in the 1950s and had enjoyed the beach and the waterfront but had not been back since," says Pichan. "But he said to see what we had done reminded him of old times once again. So it was really good to hear from someone who appreciated our efforts."
Local businesspeople also appreciated the radical makeover. One family that had owned the North Shore Inn restaurant – which Pichan says has the best burger in town – since the 1960s and kept the business open even through the bad times was thoroughly elated at seeing the area brought back to its former glory.

"In the early '60s, factories lined the area, and they had beautifully manicured flower beds and lawns," says Pichan. "The family said what we did with the course reminded them of that time when things were gorgeously landscaped."

The public will now be able to take advantage of walking trails throughout the course and canoe or kayak down a river they never could before. The ultimate goal was to create a first-class resort course that would help revitalize a depressed and downtrodden community throughout the course and canoe or kayak down a river they never could before. The ultimate goal was to create a first-class resort course that would help revitalize a depressed and downtrodden community that had been in economic and social decline for more than 40 years.

Judging by the number of homes being built in the new development, which Pichan says are going up "left and right," the project achieved that goal. But perhaps more important than the homes and the pure aesthetic beauty of their creation is the hard dollars they'll give to three non-profit organizations: Cornerstone Alliance, an economic development entity; the Whirlpool Foundation, whose namesake company owned the property and a consortium of church and community welfare groups called The Alliance. They will receive $30,000 annually, plus $5,000 or 20 percent of annual net operating income – whichever is greater. The remaining 80 percent will go toward Community Benefits programming.

To get an idea of the amount of waste that existed on the site at the onset of the project, consider that 110,000 cubic yards of garbage and more than 5,000 tires were removed and properly disposed of at the local dump. Foundry waste was used beneath large fills in the mounding along 10 of the 18 holes. Most important was the eight to 12 inches of capping sand – 130,000 cubic yards – that was used over the entire course to seal off all the contaminants and protect golfers, a requirement of the EPA.

Pichan could not praise superintendent Brad Fry more for his finish work and grassing, calling him "one of the finest grow-in superintendents in the country."

"I've never seen someone go after a course so aggressively, and it really made us shine," says Pichan. "He didn't wait – he jumped and attacked the washouts. He approached the job like a linebacker going after a running back. He just had a 'get the job done,' no-holds barred attitude."

The washouts were replaced with sod from other parts of the course Fry knew he could grow back in. Two tees on the west end of the driving range were used and a tee on the east end was used as a nursery. It was replanted three to four times, with Fry stripping it off to use on fairways or tees or other areas that were deficient.

The construction process was so long that Fry had to maintain new turfgrasses through two winters. A blend of A1 and A4 bentgrasses were chosen for the greens, Dominant Plus bentgrass for tees and fairways, Kentucky bluegrass/fine fescue blend for playable roughs and a straight fine fescue mix for unplayable roughs. Entering the winter season, Fry's crews mowed the greens, then covered some of them. He was able to mow 90 percent of the tees and fairways before winter, while the rest were treated with snow-mold applications.

Fry said the wind was extremely challenging when seeding.

"To combat the wind, we hydroseeded and used soil erosion blankets," he says. "Working on the holes that were right next to Lake Michigan was extremely difficult."

Working with the Jack Nicklaus Design team and associate Chris Rule was not intimidating, Fry says, but rather rewarding.

"I've worked with them before, so there was no intimidation factor there," he says. "If anything, it was exciting."

Pichan lauded Nicklaus Design as well.

"Having Nicklaus attached to the project drove it and made things happen," he says. "He's the best, until he gets dethroned. He's just a superb man, and he made things happen where other people cannot or have a hard time doing it."

Nicklaus Design's Chris Rule returned praise to Eagle Construction.

"There were an extreme amount of construction challenges, and Eagle Golf stayed the course and was an integral part of creating a special golf course," he says.

Irrigation of the course was one of the challenges, particularly finding a suitable water source. According to Mike Kuhn, the irrigation consultant who worked on the project, southeastern and southwestern Michigan have issues with high salt content in the groundwater. Creating irrigation ponds was out of the question because there wasn't enough acreage. The ponds they did excavate were unsuitable due to the soil quality and not knowing how it might affect the water. So
The team embraced the environmental challenges of the native plants, naming the holes after them and posting helpful information for players in the golf carts.

"Having Nicklaus attached to the project drove it and made things happen. He’s the best, until he gets dethroned. He’s just a superb man, and he made things happen where other people cannot or have a hard time doing it."

— E. Randal Pichan, Eagle Golf Construction

they ended up pumping water directly from the Paw Paw River.

“It was one of the hardest tasks we had,” says Kuhn. “Getting the necessary permits took the better part of a year, and we also had issues with zebra mussels, which forced us to take preventative measures to keep them out.”

The irrigation pump station is a vertical turbine variable speed prefabricated system capable of pumping 1,800 gallons per minute at 120 lbs. per square inch of pressure. The submerged intake is screened and positioned in order to prevent fish, including young sturgeon, vegetation and sediment from entering the intake line. The design process for the intake pipe, says Kuhn, took a long time and lots of engineering.

“Typical velocities in our intake are one to three feet per second,” Kuhn explains. “For this one, we used a 26-inch high density polyethylene intake pipe that we had to drill a series of holes in, and the holes had to be a certain size and spaced out a certain distance to keep our velocities under .25 feet per second so as to not to draw in any fish, even young fish.”

The state-of-the-art, fully-automated irrigation system consists of 1,606 sprinklers, electrically-activated control valves and a controller and central control system that minimizes overwatering. Eighty acres of fescue unmaintained areas are not.

Each hole was named after a native plant growing on it: For example, No. 1 hole is named Aster and the hole at No. 2 is named Rose Pink. Rose-pink, in addition to wild sweet potato and swamp rose mallow, were species that the State of Michigan was particularly concerned about.

Certain areas on each hole were highlighted with selective clearing, additional plantings and continued maintenance to draw more attention from golfers to the native plant species. Literature is posted in every golf cart to notify golfers of environmentally-sensitive areas. Plus, as part of his greeting, the starter explains where these areas are to golfers as well.

And what better way to officially open the course than with a skins game between legends Nicklaus, Arnold Palmer, Tom Watson and Johnny Miller – with the highlight being $3 million donated by the golfers and the Whirlpool Foundation to the Boys and Girls Clubs of America.
The easiest to install and most effective of all bunker blankets.

Now available in three great options

1. Hi Performance Sand daM™ for slopes as steep as 60°
2. Sand daM™ MR is ideal for projects where high performance and low costs are required
3. Install Sand daM™ Lite in greenside bunkers with low angle slopes, or flat bottomed fairway bunkers to eliminate contamination

The not-so Big Easy

Duininck Golf overcame a litany of logistical challenges to resurrect a historic golf course destroyed by Hurricane Katrina.

BY ROB THOMAS
Heritage Award Breakdown

**BUILDER:** Duininck Golf

**PROJECT:** Joseph M. Bartholomew, Sr. Municipal Golf Course Reconstruction, New Orleans, La.

**COST:** $7.7 million

**TERM:** July 7, 2009 to Oct. 27, 2010

**ARCHITECT:** Garrett Gill, Gill Design Inc.

**SUPERINTENDENT:** Pete Carew

**NOTABLE NOTES:** Reconstructed a devastated course to its original design, with improvements, all while keeping to Joseph Bartholomew's original vision. A true Katrina success story for New Orleans.

for weeks while the city was being pumped out and an initial cleanup was done by FEMA. Bartholomew laid vacant for nearly four years. On July 7, 2009, with architect Garrett Gill's designs in hand, Duininck Golf broke ground on the reconstruction of Joseph M. Bartholomew Sr. Municipal Golf Course.

The Pontchartrain neighborhood still bears the signs of destruction. Gill and Duininck's objective was to reconstruct the entire golf course to a similar routing plan and have it completed for a spring 2011 opening, which would help revitalize the economy.

"Joseph Bartholomew was a combination of renovation and rebuild," says Judd Duininck. "Garrett Gill did an incredible job of salvaging as much of the original design as he could. The basic routing was reused and features in the same locations. With the numerous aged live oaks and cypress that lined the course, there wasn't much room for change."

Gill, who worked closely with Kelly Gibson, a lifetime member of the PGA Tour and native of New Orleans, focused on and reused some of the unique features that were on site such as "Bird Island," according to Duininck. New green complexes and bunker features were developed, and a few tee locations changed to accommodate today's technology.

"The intent was to preserve the strategy and characteristics of the Bartholomew routing," Gill says. "We were fortunate that characteristics of the course were preserved."

Following Katrina, Gibson began a passionate pursuit to involve himself in the "rebirth" of his hometown.

"It's important for me that I give back to the community that served me throughout my career," he says. "New Orleans has an opportunity to become a golf destination post-Katrina."

Gibson also was instrumental in the design of an elaborate First Tee facility at Bartholomew.

As the news repeated in the days and weeks following Katrina, New Orleans sits below sea level. Drainage and irrigation mainline excavations were into the water table and had to be dewatered continually. Lake level connector pipes needed to be raised, which saved the owner on the lengths of pipe needed. An additional laborer was adds to the crew to aid in the production, which enabled the crew to install and get backfilled quicker.

Because soil conditions were unacceptable for building a golf course, the dirt was laid out in lifts. Long-reach excavators were needed to dredge existing ponds and Marukas - a track-type dump truck - was used to haul dirt to features. A good, sandy soil was found in a few areas on the course, which were graded first, allowing the drainage, greens construction and irrigation crews to continue work and get these

The Joseph M. Bartholomew Sr. Municipal Golf Course was devastated by Hurricane Katrina, but Duininck Golf rebuilt the course, helping the local community and economy to heal.
holes nearly completed while the dirt was

drying on the other areas.

“Soils in New Orleans are definitely the
toughest soils we have encountered,” Dun-
inck says. “Harris Duininck, one of the senior
partners in our company was on a project we
had in New Orleans with me one day and

says: 'Judd, if we come out of this project
making any money you can say that you have
accomplished something, as I haven’t seen
conditions this tough as long as I have been
around the business, and that is over 50 years.’

“Having built courses in New Orleans in
the past there is one thing you need, and that
is patience,” Judd Duininck adds. “The dirt
moves slow and dries slow. In other parts of
the world a golf course contractor can use
large excavators, scrapers and haul trucks.
In New Orleans you get to use Marukas with
a half load on them. Like they say, ‘patience
is a virtue.’”

Finding qualified contractors to meet the
Disadvantage Business Enterprise require-
ments was difficult for Duininck. An earth-
moving subcontractor had to be replaced and
their work was completed by Duininck to
keep on schedule. The additional costs were
not anticipated, but had to be assumed.

The first cap sand contractor had to be
replaced, as well. Spot checks on truckloads
of sand were coming up short of what was
billed. Considering more than 50,000 cubic
yards of sand was used, losing more than a
cubic yard of sand with each truck would
have led to a shortage of more than $75,000
worth of material. Duininck tapped a prior
relationship with a contractor and negotiated
a deal that provided the correct amount of
material for to the project at a price that met
the expected budget.

The original start date of April 1, 2009, was
moved back a month, then to July 7. Much of
the prime earthmoving months were lost and
a spring 2011 opening faced the team. Despite
subcontracting issues and an average annual
rainfall of 86 inches, the course needed to be
shaped in time for the ideal sprigging period
of March and April. Duininck adds person-
nel during the winter months while colder-
climate projects were shut down.

“Despite the late award, our construction
superintendent, Ahren Habicht, and his

team did an outstanding job of fast-tracking
the schedule. We were still able to success-
fully plant the course over the summer and
grow it in for a fall turnover to the City of
New Orleans,” Duininck says. “With the city
having a construction management firm to
manage all of the reconstruction projects in
New Orleans, and funds coming from three
different sources – FEMA, City Block Grant
Funds and Capital Projects – getting any
requested changes through the system took
longer than anticipated.”

Throughout the process, Duininck Golf was
to report to one individual – the construc-
tion manager for the City of New Orleans. From
the pre-bid to final acceptance, five different
project managers were assigned to the project.
Gill and Habicht were diligent in keeping ac-
curate communications and Habicht would
spend hours getting each new construction
manager up to speed, which kept the project
moving forward.

Though the project started July 7, the first
month’s work was not paid in full until around
Thanksgiving. A local construction attorney
was used to consult with for advice on how
to get payment out of the city, which resulted
in action being taken by MWH Management
and the City of New Orleans. Money was
ultimately paid.

Because of the poor soil conditions, haul
roads were constructed out of plating sand
to allow trucks to maneuver through the site.
In addition to sand for each hole, which
was calculated in advance, these haul roads
were used to bring in concrete for cart paths
and greensmix for tees and greens. In areas
that were too difficult to maneuver trucks,
dump carts were utilized to add the needed
materials.

“Getting materials into the features and
cement concrete to the cart paths is
always a chal-
lenge in New Orleans. Joe Bartholomew was
no exception,” Duininck says. “Dump carts
and Marukas got quite a bit of use.

“As far as easier, it was great to have PGA
pro Kelly Gibson on the Gill design team,”
he adds. “With Kelly living in New Orleans,
we were able to get design decisions made
quickly.”

A prolonged dispute between the city and
power company forced Duininck to go
without power for more than five months at
the beginning of the project. While Duininck
was able to complete work not requiring
power (much of the irrigation system was
completed and only needed to be flushed and
programmed when power was established),
grassing the course was in serious jeopardy.
Once power was provided and a pump station
installed and operational, grasping was fast
tracked from a schedule of 104 days to just 61.

“In the history of golf courses, this little
construction window is just a small blip,” Gill
says. “We’re extremely proud of the project
and proud of the City of New Orleans for
caring about it. It was a remarkable effort
and I think golfers will find it a remarkable
course to play.”

Duininck concurs. “We as a company are so proud of how the
Joseph Bartholomew course finished out,”
Duininck says. “Garrett Gill, Jon Schmenk,
and Kelly Gibson did a fabulous job of tailor-
ing this course to fit the property and the
needs of the community. The course is going
to be a real anchor, and hopefully rejuvenate
the historic Gentilly community of New
Orleans.”
