to have so many additional irrigation options for daily resort play and especially for tournament preparation. The ability to isolate water distribution uniformity to site-specific areas means Chris and his staff can provide consistent playing conditions for resort guest as well as U.S. Open contestants.

Chris explains how Pebble Beach is more water friendly that ever:
• Courses use less water by irrigating an area with only one sprinkler head rather than a group of heads. That means less overlap and less water.
• Playing conditions are more consistent thanks to eliminating overly wet or dry spots.
• Courses use less water by irrigating an area with only one sprinkler head rather than a group of heads. That means less overlap and less water.
• Playing conditions are more consistent thanks to eliminating overly wet or dry spots.
• They can be sure of a more controlled dry down for tournament play with fewer man-hours of labor and an even distribution of water. This would have greatly enhanced the USGA’s “brown is the new green” philosophy during the 2010 U.S. Open Championship.

It’s true, PBC is better able than many facilities to have the financial resources to implement this kind of program. But that doesn’t mean other courses, clubs, and resorts can’t find new ways to improve their water systems while improving the game and their relationship with their local environment and their neighbors. Every superintendent should be devoting time and resources to water. Both individually and as an industry, we must keep doing this and conducting turf grass research on all levels.

Water issues are only going to get more serious, and very soon, in many parts of the country – as well as around the world – water could become more precious than oil. It is a precious resource that has to be shared with every other living thing on the planet. The example of Pebble Beach shows that we all have to work hard and intelligently – and not wait until the last minute – to address these issues. Because if we don’t find new ways to use less water, we soon won’t have any water at all.
MY GREAT LAKE

GCI's intergalactic headquarters sits a half-mile or so from the banks of Lake Erie. On quiet mornings, I'll occasionally hear the low-pitched horn of tugboats as they haul humongous container ships out into deep waters. The sound reminds me that I live and work right next to one of America's Great Lakes.

The big lake is pretty clean now thanks to decades of improvement in waste disposal driven by the Clean Water Act which, ironically, was spurred by the fact that the Cuyahoga River was so damned dirty it caught fire 43 years ago. Now, you can eat all the perch and walleye you want and the beaches are crowded with swimmers who do not seem to be growing extra appendages or keeling over after frolicking in the lake's gentle waves.

Occasionally we hear concerns about the big dead zones in the middle of the lake where nothing grows. For a while, activists pointed fingers at agricultural and lawncare chemicals (just because we're an easy target) but most scientists now believe it's a natural phenomenon. The bigger threat to the lake is invasive species like the snakehead carp and the now ubiquitous zebra mussel...a couple of Asian imports we could have done without.

The lake dominates our weather. God forbid you live on the eastside of town when the big snow machine kicks into high gear. Buffalo ain't got nothing on us when the north wind blows across Erie and deposits a foot of snow on your doorstep.

For Clevelanders, the lake represents many things. For some, it's a symbolic connection to the past when Erie was a superhighway for goods and raw materials processed here before the city starting rusting away. For others, it's a playground for boating, fishing and shore-side living. And, for the smart few who think harder, it's by far the biggest and most valuable asset the city has, for that blue water is really gold for the future.

Erie is a relatively puny member of the Great Lakes family. It's dwarfed by the bigger and deeper Michigan, Huron and Superior. But, even though it's the runt of the litter, the lake that sits in my proverbial front yard represents about 2.5 percent of the usable fresh water in the world. The Great Lakes as a whole are 21 percent of every drop the planet has to drink.

How we manage fresh water – who can use it, who controls it and how it is allocated – is the single largest resource question facing humanity. Overpopulation, desertification, deforestation and a bunch of other "ations" are soaking up water faster than Mother Nature's slow, steady cycle can replenish it. It's a quiet crisis that I suspect will be far noisier in the lives of our grandchildren and their grandchildren. In the scary George Jetson version of the future, we'll all be gadding about with jetpacks but we'll be thirsty as hell.

Golf is a pimple on the ass of the overall water crisis we face as a species. In the very long term – say 200 years from now – it's hard to imagine that a wise civilization would allocate one drop of a life-sustaining, precious resource to a goofy recreational activity involving sticks, balls and plaid pants. Perhaps we'll have conquered desalinization and I will have been dead wrong. Mostly I'll be dead so I'm not concerned about being wrong.

I've written before that your golf course's water "rights" will gradually and regionally be challenged by rationing, statutory reductions in acreage, dramatically higher pricing and forced conversion to non-potable sources. It probably won't happen in one sweeping new law or some other catastrophic blow, but it will come in the form of "death by a thousand tiny cuts."

Am I being melodramatic? You decide, but I'll ask you once again: Do you seriously believe our industry's use of fresh water will go unchallenged for much longer?

Many of you are ahead of the curve based on today's dictates about turf irrigation. You're being proactive.

Do you seriously believe, our industry's use of fresh water will go unchallenged for much longer?
SipcamAdvan is all about minimizing turfgrass stress and maximizing turfgrass health. With that focus in mind, we are devoting considerable resources to our exclusive line of ETQ™ turf fungicides. Supported by lab and field research, these science-based solutions blend proven active ingredients with ETQ technology. The result is simultaneous disease control and protection from UV light, heat and other stress factors. Your reward is improved turf color, strength, density and consistency . . . along with excellent disease control. ETQ technology. Discover the benefits.
