Golf courses are looked to as the turfgrass proving grounds of the world today. A new product put forth for use at any area where turfgrass of high quality is desired cannot claim to have been proven until it has been accepted for practical use on a golf course.

The golf courses also are the show windows of everything required for the production and maintenance of fine turfgrass, whether for sports or residential or commercial use or other beautification and utility.

This vast and sharp focus of public inspection on the golf course superintendents' work, and the superintendents' powerful and far-reaching influence on the marketing of everything needed for growing and retaining fine turfgrass, has placed a heavy professional responsibility on the men who manage golf courses.

During World War II when it became apparent to military leaders that grass was a strategic engineering material, many golf course superintendents were called upon to assist in far-flung grassing projects. It is a credit to the profession that superintendents were able to convert and translate their knowledge of peace-time pursuits into something of great military value.

Seeds and stolons and sprigs of almost every grass that has or is believed to have turf value have been planted at one time or another on golf courses. Here they have been subjected to tremendous variations in soils, climate and management. Here only the hardiest survive to be called superior.

Machines designed for the maintenance of turfgrass areas receive the "acid test" on the golf course.

Those that are accepted and used regularly very soon are adapted for use on other areas for other turf interests. It has been said "the development and maintenance of a putting green represents the highest form of agriculture".

Golf course tees are similar in many respects to athletic fields where cleated shoes and constant trampling render grass growing difficult, to say the least. Fairways are closely akin to the kind of lawns that millions of folks would like to have. The rough on the golf course is like the city park, the highway strips or the local airfield in many respects.

The golf course superintendent can be secure in the knowledge that even though his authoritative position may not be publicly acknowledged and appreciated, millions of people depend upon the kind of practical grass information that he has helped to develop and accumulate.

Q—I am a doctor and on occasions when I have free time I would like to be able to do some practice putting in my back yard. How do you build a backyard putting green? (Del.)

A—The first thing to do is to consult with a local golf course superintendent who is the authority on putting greens in the area. The superintendent can look over the site and see if the location is suitable, if the soil is favorable, and other technical details.

Cost of establishing and maintenance may be important. In a few cases the superintendent may let one of his workmen care for the green after hours. If the green is to be bentgrass, the details of fertilizing, watering, mowing and spraying for diseases are too much for the layman and should be handled by the best professional turfgrass man—the golf course superintendent.

It may be possible that the local golf course may have a nursery of putting green sod which could be moved intact to produce the putting green quickly. To
