Grau's Answers to Turf Questions

Superintendent Recognized

The American Home magazine for April 1960, carried an article, "Want a Lawn Like a Putting Green?" by Theodore A. Weston, garden editor. The course described in it was Williams Country Club, Weirton, W. Va., where Charles (Chuck) Onoretta is the pro-supt. Excellent photographs, accompanying the well-written script, showed the relationship between golf courses and home lawns — their similarities and their differences. Clear cut explanations of fertilizing, watering and management systems gave readers an idea of a supt's skills and abilities. This well-deserved recognition of a supt. will be of great interest and value to the millions of lawn lovers who would like to have a lawn that looks like a golf course at its best.

For the last month, Fred V. Grau has been in the National Orthopedic Hospital in Arlington, Va., where he underwent spinal surgery in mid-April. He expects to be released in time to return to the turf plots around June 1st.

Heavy Soil in Greens

Q. Under separate cover I am sending you soil cores from three greens. I would like to have your analysis of these samples. Our greens appear good but they have that rusty look when you look at them from the side. I thought it was thatch because we closed last Nov. 1st and then had a warm month and quite a lot of growth, with no mowing. This spring I have verticut once a week, hoping it would help. I'll appreciate any help you can give me to solve this problem. (Ohio)

A. Upon examination of the soil cores from the three greens, I find, first of all, that the soil is very heavy. It has far too much clay in it, thus holding an excessive amount of water. Apparently the roots are having great difficulty penetrating the soil. There is a considerable amount of thatch and mat on the surface. The No. 4 green had about an inch. This could cause you a great deal of trouble because fertilizer and water and air will have extreme difficulty in getting through this matted layer so that it can benefit the roots below. Right now there really aren't any roots below this matted layer.

You should keep on with light verticuting in order to continue to reduce thatch and mat. In addition, you're going to have to do considerable deep aeration and topdressing with sandy material so that as much as possible works down into the holes. It is going to be quite essential to get as much sand as possible worked into these greens for better aeration and drainage.

Recommends Nitrogen Feeding

In addition, I would suggest that you consider going on a good nitrogen feeding program. The time to make a good application is when the greens are open and at the time you are working sandy material down into the open holes. You will get the maximum material down below the matted layer to encourage deeper rooting.

The rusty look apparently comes from poor nutrition. It could be the beginning of a serious disease problem, a Helminthosporium-Curvularia complex. This is rather common when greens are poorly aerated, have heavy clay soil and tend to stay wet. By lengthening the periods between irrigations, you can let the surface of the greens get quite dry, meanwhile keeping good moisture in the sub-surface. This will encourage deeper rooting. There may be a few squawks from the standpoint of hard greens, but these shouldn't be too serious. The sandy material that you work into the aeration holes will help to hold a shot even when the surface is dry.
