DOLGE PRODUCTS
for MAINTENANCE

Weed Killers
Insecticides
Golf Ball Wash
Mole & Gopher Killer

Free Turf of Dandelions, Plantain
E.W.T. (2,4-D) WEED KILLER
Selective. Rids turf of dandelions,
plantain, other broad leaved weeds
without injuring good grass. Non-
poisonous. Dilute up to 400 parts of
water; spray.

Rid Turf of Destructive Insects
SOLEXTO
Kills bugs in and on turf. Dilute in
up to 400 parts of water.

Exterminate Moles and Gophers
NOMOLE
Finishes moles; punch holes in runs
and pour in. Kills gophers, too.

Eradicate Weeds on Parking Lots, Roads
SS WEED KILLER
Can kill any weed it hits. Use on
parking lots, drives, walks, sand
traps, and other places where you
want no growth whatsoever.

Wash Golf Balls, Quickly, Thoroughly
DOLCO PINE BALL WASH
Right for rotary or paddle machines;
has pine aroma; efficient, agreeable.

Connecticut

Turfgrass research review
by Dr. James B. Beard

Turfgrass variety Evaluations

Performance of Kentucky Bluegrass, Perennial Ryegrass, and Tall Fescue Varieties.

C. R. Funk and R. E. Engel. 1967 Report on Turfgrass Research, New Jersey Agricultural Experiment Station Bulletin 818, pp. 67-71. (from the Department of Soils and Crops, Rutgers, the State University, New Brunswick, N.J.).

Nine Kentucky bluegrass, five perennial ryegrass and six tall fescue varieties were established March 30, 1963, on a fertile loam soil of moderate drainage at New Brunswick, N.J. The plots were mowed at a height of three-fourths of an inch with clippings returned. The area received minimal irrigation with two irrigations applied in 1964 and in 1965. Thus, the area had severe drought stress at times. A split plot fertility treatment involved four and six pounds of nitrogen per 1,000 square feet a year.

Disease observations on the Kentucky bluegrass varieties are as follows: Fylking (0217) and Merion had good resistance to Helminthosporium leafspot and formed the highest quality turf during the test period. Some deterioration in the turfgrass quality of Merion occurred in the spring of 1966 which was caused by stripe smut. Windsor also exhibited some injury. NuDwarf and Delta were seriously thinned by Helminthosporium leafspot. Newport, Primo and Campus had moderate damage from this disease.

Among the perennial ryegrass varieties tested, Norlea exhibited the slowest rate of vertical growth and also tended to be somewhat less difficult to mow. Norlea has a dark green color which is particularly evident during the cooler fall period. Under New Jersey conditions, Norlea has shown good persistence and density. NK-100 has also shown good persistence and density. Linn and Tasmanian have rated relatively low in turfgrass quality because of steminess and low density. They also tend to produce a higher percentage of reproductive tillers in late spring. Norlea, NK-100 and Viris tend to be leafier and of higher density during this spring period.

Kenwell tall fescue has shown good promise compared to the common tall fescue varieties now available. Kentucky 31 and Backfall ranked somewhat lower in overall quality than Kenwell. Goar and Alta ranked lowest in turfgrass quality of the tall fescue varieties included in this test.

Comments: This progress report on turfgrass variety evaluations at Rutgers is a contribution in the continuing long term turfgrass variety evaluation program at various universities across the United States. The observations regarding relative disease resistance and susceptibility of the Kentucky bluegrass variety are of particular interest.
