PUT WINTER TREADS ON YOUR GREENS

Highland Colonial Bentgrass—one of the most economical of the fine-bladed varieties—offers a distinct advantage in an overseeding program. It shows uncommon strength during that crucial spring transitional period when your dormant grasses are coming on. While many of the cool-season grasses in your mixture may fold sooner than you like, you can count on Highland to hang in there until the native grasses recover.

With 8 million seeds per pound, your potential number of plants is exceptionally high. Highland holds its color in the winter and you can close-cut it to ¼ inch.

The only machine that tills sub-soil seven inches deep without punching

The results of the Sub-Aire Aerator are amazing on a compacted green. Deep "hard pan" compaction is broken up well below the root system. Permits moisture, oxygen and fertilizer to penetrate really deep, promoting a deeper root system, thicker growth and restoring natural resiliency. No holes are punched into the surface, which means there's no debris to clean up and no "pegboard" putting surface on the greens.

And all it takes is one man and one Sub-Aire Aerator to do the job. For further information write Dept. 119.

If you have questions to submit to Dr. Grau, write him c/o GOLFDOM, 235 East 45 Street, New York, N.Y. 10017.

Emerson

(Continued from page 8)

• Whether there are any documented articles or bylaws
• Whether the corporation has a civic, fraternal or social purpose
• Whether there are any formalized procedures for becoming a member or for being expelled from membership
• Whether there are membership cards, a membership roster or established procedures for admitting guests of members.

Judging by these standards the essential factors which determine whether an establishment is a private club or serves the public are the extent to which the membership is genuinely selective on some reasonable basis; a fair start on an important question.

Q.—We have been looking for a reliable publication on "Ground Covers." Can you help us?

(Pennsylvania)

A.—A good circular came to my desk recently. It is Special Circular 108, The Pennsylvania State University, University Park, Pa. 16802. Craig Oliver, Horticulture Extension, is the author.

Q.—Is there a possibility of controlling mosquitoes by the sterile-male technique, which was successfully used on the screw-worm?

(Florida)

A.—Yes, success by this method has recently been reported in Science, Vol. 168, 12 June 1970, pp. 1368-69, by R. S. Patterson, et al, USDA, ARS, Entomology Research Division, Gainesville, Fla. The mosquito involved is Culex pipiens quinguefasciatus, a vector of human diseases, particularly filariasis. The sterilizing agent is thiotepa.
