Budget Preparation: Directions 1972

BY JOHN LESURE, CPA

Today many factors can influence a budget. The more financially aware a club manager is, the easier economic predictions become.

Compared with commercial enterprises, golf clubs have greater difficulty controlling or at least predicting revenues. A business can adjust prices, offer inducements and increase its advertising; it can even introduce new products. If it operates a dining room, it can change the menu. Changing prices at a golf club is difficult. The club depends on member support, which may fail at times. All in all, patterns of member support can be unpredictable, which adds to the budgeting problems of the club manager.

To generate income and cover their expenses clubs rely mainly on dues, assessments and initiation fees. Revenues from fees and meals may cover the costs of the individual departments or these departments will operate at a loss. Such revenues from all sources, however, cannot be counted on for more than a modest contribution towards meeting the club’s fixed expenses.

Expenses also are far more intractable for the club manager than for his counterpart in business. The club manager is not free to make changes in the services offered, nor in the quality of service. He must predict as accurately as possible the costs of those services into the future, so that there will be a basis for the directors and the members to work out in advance ways to raise funds to meet those expenses.

### Estimating costs

**Cash forecast.** To prepare a cash forecast, set up weekly work sheets for 10 weeks. Then set up enough monthly worksheets (six months is usually sufficient) to carry the club through any seasonal lows.

Cash requirements should be recorded in the following order: 1) estimates carried forward from the previous forecast with all necessary adjustments; 2) figures transcribed from fixed payment schedules for long-term debt, rentals and property taxes; 3) other recurrent or regular payments, such as payrolls and payroll taxes; 4) accounts payable, from a summary of the bills on hand; 5) contractual obligations already entered into, for which bills have not yet been received, and 6) estimated expenses that will be incurred.

When all estimates have been recorded and weekly and monthly requirements totaled, the beginning cash balance is entered on the worksheet, followed by estimates of revenues. It is at this point that shortages become apparent, and ways must be found to cover them. This is the basic purpose of forecasting.

**Break-even budgets.** In preparing operating budgets, record all the fixed expenses of each activity first, then calculate the volume and revenue level required to break even. These calculations are simple and should be made for all revenue-producing activities.

Break-even budgets of this type can alert the club manager in advance to potential problem spots: those activities that are not likely to achieve their break-even volumes. In addition, periodic reports of actual results and variances from budgets will show other problem areas that may be developing, whether anticipated or not.

### New tax regulations

Tax exempt clubs are now subject to new record-keeping rules and other changes in the treatment of certain types of income. Tax exempt status itself is separate from the question of taxable income. If gross receipts from nonmember use exceed $2,500 or 5 per cent of total gross receipts, the club’s exemption may be questioned. For the purpose of this calculation, gross receipts do not include investment income, initiation fees, capital contributions or proceeds from the sale of club assets.

Investment income and nonmember income are now taxable. Nevertheless, for most clubs it is still advantageous to retain their tax exempt status because of liquor license benefits, freedom from some state taxes, special deductions and postponement of taxes on property sales by reinvestment, in addition to the tax shelter on profits from members and their guests.

The new regulations have had significant impact on investment income. Accordingly, budgets and cash forecasts should include calculations of taxes on interest, dividends and capital gains from securities, bank accounts or other investments held by the club.

At many clubs the impact on nonmember income has been less significant, but if a banquet is going to be held at your club by outsiders, then the club must prepare to incur a tax liability. To avoid paying taxes unnecessarily on small parties, the club must keep adequate records showing how many people were in each party and how many were members; what part of the club income is from exempt functions and what part is taxable.
and how the club allocates its expenses.

In estimating the tax bite the Internal Revenue Service will get, look out also for state tax laws that are brought into conformity with Federal regulations. There could be another payment due to the state.

**Technological developments**

Electronic data processing is now available to clubs in ways that are within their means. Mini-computers offer sophisticated capabilities in-house at low cost. Time sharing facilities may be rented for brief periods of use outside. Furthermore, simulation models are being programmed and applied to business problems. Similar models may become available to clubs in the near future.

The significance of these developments to the budgeting process is that a budget is a mathematical model of the operations of an organization. Don't let terminology get in the way of understanding. Your budget can be programmed for a computer to gain two separate advantages. First, you will be able to prepare and revise a budget much more rapidly than ever before. Second, in a real-time model, you will be able to ask the computer about the affects of proposed changes in policy or anticipated changes in external conditions; and the computer will respond promptly.

**Meeting responsibilities**

**Fundamentals.** Along with an accumulation of experience and knowledge, a club manager should conscientiously set about developing a financial awareness that will help him to see his operation in its relation to the larger economic picture in the community and beyond. He should acquire an understanding of how fluctuations in the economic activity in his area affect his club, because the spending patterns of members and the entertaining they do are influenced by their own economic circumstances. These in turn are influenced by local conditions.

Local business conditions reflect national economic forces. When construction throughout the country is held down by tight money and high interest rates, the effects are felt in local communities. When a particular industry is hurt nationally by strikes or threats of strikes among its suppliers or customers, the local economic awareness, however acute, is not enough. Formal schedules and projections are indispensable planning aids. Because prompt payment of obligations is the only way to maintain a good credit rating, there must always be detailed plans for meeting debts when they come due. In particular, long-term debts must be serviced regularly and payments are often heavy in relation to other payables. A formal procedure, therefore, is appropriate for transferring individual payments due, from a complete schedule for each long-term debt to a short-term projection of cash requirements. Similarly, schedules of real estate and personal property taxes should be maintained for transfer of payments due to the cash projection that is used in planning.

Many payments come due at dates other than the first of the month. Payrolls, for example, must be met weekly. Accordingly, cash projections should be prepared on a weekly basis to avoid embarrassment that could result from a monthly plan that failed to note a timing problem between receipts and disbursements.

**Budgeting: standard concepts.** There are two ways to approach a club budget. First, expenses may be estimated for the operations that are desired; sources of revenue are then sought to cover the estimated expenses. Second, anticipated revenues may be totaled up first, so that resources may then be allocated to various activities. Whichever method is favored at a club, certain forecasting techniques are helpful in preparing a budget.

One basic method of forecasting is to extrapolate past trends. The usefulness of extrapolations can be enhanced materially by analyzing revenues into separate activities and determining the trend for each one. Restaurant revenues should be estimated separately from membership dues, green fees from guests of members and locker room charges. If there are different kinds of memberships, each should be estimated separately.

Accuracy can be improved still further by analyzing a revenue item into its component parts and estimating each component. For example, the income from a service or rental is likely to consist of a fee for use times the number of people who use the service and pay the fee. An estimate of the number of people multiplied by an estimate of the average fee will provide a more reliable forecast than a simple extension of a trend line of past receipts.

Historical records are valuable in projecting seasonal patterns, a necessary element in forecasting the short range flow of cash. When annual projections of revenue are further broken down into monthly segments, not only can all cash forecasts be related to the annual budget, but the budget itself can be subjected to early and frequent comparison with actual operations, so that variances can be analyzed and their causes investigated.

Accuracy in forecasting can be im-

You can search out, interview and investigate candidate after candidate to find just how tough a job it can be. You've got to get just the right match of skills and experience. The human chemistry has to work with your club's special needs and desires or it's no good.

You can search out, interview and investigate candidate after candidate to find your man. Or you can let us do it for you.

Golf Professional Selection Service, Inc. has access to a wide range of the most qualified pros in the country. We find out exactly the sort of pro you want, then, with the help of our Advisory Staff experts like Johnny Farrell and Ray Daley, we find him for you. Thoroughly researched and investigated, perfectly matched to your needs.

Let our professionals find your professional. Quickly. Carefully. Confidentially. Ask us:

Finding your club pro is no job for amateurs

Golf Professional Selection Service, Inc.
P.O. Box 506
Palm Beach, Florida 33480
A Division of Seaton-Wade & Company

Note to golf pros: Your inquiry is welcomed. No cost or obligation, of course. For more information circle number 205 on card

proved further by reviewing economic conditions and the factors underlying the figures. How do the new members differ from the old? Their average age may be lower. They may have different interests, life styles, income levels and spending patterns. Careful analysis of changes in membership may point the way to marked improvements in forecasting. What is the outlook for local business and how will this affect the membership rolls and spending levels? As much information as it is possible to gather economically should be made use of in budgeting.

In estimating expenses the basic distinction to be made is between fixed and variable costs. Fixed costs are those that remain constant regardless of the level of operations. Property taxes may be higher this year than last, but they are set for the year no matter how many new members join or old ones leave. They are properly regarded as fixed expenses. Food consumption in the dining room will vary with the number of people who come in to order meals. Because food costs vary with food sales, they are variable expenses. Labor is a fixed expense, because a staff must be hired and kept on almost without regard to volume of activity.

The factors that cause increases in fixed costs from one year to the next are increases in tax rates, insurance rates and wage rates as well as changes in the property the club owns through new acquisition or construction. Increased valuation may result also from re-assessment or inflationary trends.

The principal variable cost item, food, is subject to long-term inflationary trends. In addition seasonal and short-term fluctuations are characteristic of food prices, making prediction hazardous. Nevertheless, predictions of published sources are available, based on crop conditions, quantities in storage, export requirements and other relevant factors. They can be helpful.

Estimates of expenses will prove to be more realistic when department heads and responsible employees are involved in the budget process. Not only are their estimates based on familiarity with their own operations, but they are likely also to try to make good their own projections.

Another technique to improve budgets is to methodically review the feedback from operations under previous budgets. This feedback is customarily studied from the standpoint of operational control; it is necessary to consider also the possibility that the formulas and parameters of the earlier budget are themselves in need of adjustment or modification.

Control. Although planning is one principal purpose of budgeting and the purpose that dominates in the early phases, control is the purpose that dominates the operational phase. The budget is the plan and control is a matter of adhering to it.

Adherence to budget is fostered by regularly comparing actual results with budgeted figures and investigating variances in a search for causes that can be remedied. Promptness in reporting variances is essential to prompt action in correcting problems before they become serious. A system for prompt, regular reporting of variances is essential, but is not enough. Key employees should know also how to make effective use of budget data and variance calculations.

Feedback should be sought from all those who work with the budget, particularly from department heads and committee chairmen. Their reactions to the budget and their opinions of its effectiveness in operation should be routinely obtained and recorded as a basis for improving both budgets and operations in the future.

The swift changes in economic conditions that characterize our age make financial management more difficult and at the same time more important. Expert knowledge is essential for success in this area, plus an awareness of current developments. Moreover, these attributes must be applied to regular methodical financial planning.

Club members and directors must also be reminded of the influence of policies on financial results. Management decisions affecting the club's operations and its finances must be considered in the light of the club's financial capabilities before they are adopted. Sound financial management depends on timely information in the hands of decision makers.
