become more competitive in price. Wheat and soybeans rose 300 and 200 percent, respectively. Therefore, only those turfgrass varieties that can guarantee the farmer an annual per acre return of $450 or $500 or that are of comparable value because they possess outstanding turf qualities, will be able to withstand the competition as long as wheat prices of $5 a bushel remain in effect. Other turfgrass types will simply be plowed out. Unfortunately, many of the best turf varieties are notoriously low seed yielders.

The modern American farmer is an excellent businessman who has seen how valuable his products are on the world food and fiber market. He will certainly use his assets to his own advantage to ensure a high return on his investments. If the rest of the world is willing to pay higher prices for agricultural products, Americans will not pay lower prices.

ANTI-BURNING LAWS

Another big shadow affecting turfgrass seed production and ultimate cost is the soon-to-be enforced anti-burning laws. Burning of the debris left in the field after harvest plays an important part in the annual cycle of grass seed production. Burning shocks the dormant plants, causing regrowth and stimulation of the reproductive cycle. Burning thins out the over-all stand to allow more reproductive stems to develop, destroys surviving disease and insect organisms that can seriously reduce future seed yields and effectively removes large quantities of straw that would otherwise have to be mechanically gathered.

The smoke caused by normal field burning has been ruled environmentally unacceptable: to date, no other sanitation method has been found. Research efforts are still underway to develop new smokeless, high heat intensity burners, which would be used after the straw had been mechanically removed. The increased cost of fuel needed for this operation will also effect seed prices.

The new anti-burning laws, which will halt all open-field burning by January 1, 1975, are expected to increase seed costs considerably, due to lower seed yields, higher cost of debris removal and greater use of chemicals to combat insects and diseases. Alternative uses for many thousand tons of straw are being investigated, but the key to continued successful grass seed production remains field burning after harvest.

FERTILIZER SUPPLIES

Over-all production costs will continue to rise if present trends persist. Since last November, when price controls were removed, fertilizer prices have doubled. This only nominally affects seed prices. The real fear is that fertilizer supplies will be depleted due to the energy crunch. Almost all nitrogen is produced with natural gas, which is becoming more costly as it becomes more scarce. In some areas of the Pacific Northwest, fertilizer dealers are cutting their deliveries to growers by 25 per cent. Invariably, this will result in lower seed yields, lower seed quality and higher prices.

Inflationary trends, if they continue, will prevent price lowering in the near future. Foreign demands promise to remain strong for the coming year. Unless 1974 is an exceptionally good crop year, prices are likely to remain high.
