Manager's Association Plans
Many Helps for Clubs
By HENRY R. DUTTON
Sec. Club Managers' Association of America

The Club Managers Association of America is composed of more than seven hundred managers of proven ability who are connected with leading clubs throughout the United States. Its members are scattered throughout the United States. Successful managers of prosperous clubs are members of this association.

The association exists for numerous purposes. Some of these are the elevation of the profession to a higher level, self-education and research work; the bringing of new modern ideas in business practice into club management; the setting up and maintaining of a code of ethics as a guide for managers in their deportment and business dealings as representatives of clubs, and it also has a number of other policies which, while benefiting the manager, also benefit clubdom throughout the country by bringing to it more efficient operation and better service.

The association now has a clearing house by which it furnishes a service to clubs that are in course of construction by giving advice concerning their plans for more economical and efficient layout, to aid them in selecting the type of equipment best suited for their needs and also to help them to procure managers whose records are such as to place them in the forefront of the profession. Coincident with this is the service to our members in helping them to secure positions with worth-while clubs desiring such service.

Pick Good Men

There is no finer material available in this country than that which Club Managers Association of America has to select from, and we will be very happy to aid club officials in their search for types of men who can fill the position of manager with credit to the association and with profit and satisfaction to the club.

In co-operation with GOLFDOM and other trade journals going to club officials and managers, the association feels it is able to offer the very highest type of men for positions. Our tests for eligibility are severe, and it cannot afford to recommend any man whom it does not feel would reflect credit upon its good judgment.

We offer this service as well as free advice in regard to plans, specifications, lay-

Green Section Meet Stirs
Greenkeeper
(Continued from Page 42)

and west, as well as a number of demonstration plots sponsored by individual clubs. The seed, fertilizer, etc., are supplied by the Green section.

Having attended regularly the Green Section meetings in New York since their inauguration (January, 1924), one feels (if we except for the moment an interesting paper now and then like Dr. Hinman's this year, Dr. Lipman's last year, Prof. Leach's paper on Japanese beetles the year before) very much like Omar when he said:

"Myself, when young, did eagerly frequent Doctor and saint, and heard great argument,
But evermore came out by that same door
As in I went."

It seems to be the same tale every year. So well put in the Metropolitan Green Section Bulletin, December, 1929: "Nothing very definite in the way of conclusion can be drawn at this time. However, many observations were recorded during the season." This was all very well for the first few years, but one feels that after seven or eight years of observations by the Green section more definite information should be forthcoming. The reason for this rambling of mine seems quite obvious.

First and foremost, the practical greenkeepers feel they have been ignored, notwithstanding the fact that the attendance at these annual meetings would not exceed a dozen if the greenkeepers were to absent themselves. Their resentment naturally is reflected in a feeling of antagonism instead of the feeling of cooperation that should exist.

Secondly—The heads of the Green section, when not answering correspondence, are kept so busy rushing from one end of the country to the other that very little time can be given to actual investigations.

Thirdly—Greenkeepers disagree with the manner in which most of the experiments
have been carried out. For instance, the turf gardens at Arlington were first started on the basis that nobody knew anything about the growing of turf grasses scientifically. This was a fallacy. The fundamentals of turf were well established two decades before the Green section came into being.

Questions Value of Location

It is a fact that the large majority of golf courses are within the limits of the temperate zone. It is also a fact that the fine turf grasses are at home in this area. Therefore, any study or investigation of these grasses must be carried out in the temperature zone. The nearer northern grasses are grown to the southern limit of culture the less satisfaction they give, and southern grasses are not worth planting in the north. From this can be seen that any experiments of trial plots as far south as Washington have relatively little value as to how northern grasses would act in their native habitat. Nevertheless this is what has taken place, and we are asked to believe the results of these experiments, which include the condemnation of many of the grasses that have withstood the test of time, as to their usefulness and durability in the north. I mention red fescue as being one.

I know of no agrostologist that has carried out a reliable investigation of northern turf grasses in the northern zone. The most specific data we had was gleaned from the turf garden of the late J. B. Olcott at South Manchester, Conn. The most beautiful piece of turf in his whole garden was the much maligned red fescue. Fredrick Taylor, the efficiency expert, bought the plots after Mr. Olcott’s death and transferred them to Philadelphia in 1912.

That there should be an experimental station in Washington everybody is agreed, but it is hard to see any value in the demonstration plots which are scattered about on different golf courses. In the first place, skilled investigators in almost any line are scarce, but when it comes to turf they certainly are at a premium. That a skilled investigator is necessary goes without saying. Therefore, we are forced to ask: Where are they, and the money to pay them, to come from?

The mere fact that you grow a piece of turf here or there means nothing at all. The intermittent visits of a first agrostologist or his second-class deputy will prove less. The individuals or crew looking after the different plots have their own ideas as

to treatments. Although hard and fast rules may be laid down, there is nothing to prevent those doing the actual work from carrying out a little investigation of their own, just to prove the other fellow was wrong. If it turns out all right, he will either put it in his book of secrets or boast of it. If it goes wrong, he forgets that anything was done other than ordered.

There is one logical way to remedy these ills, and that is to find out what the guardians of the golf courses, the greenkeepers, want. This will vary with locality somewhat, but not so much as to be beyond the range of a regularly established agricultural or botanical experiment station. Let each station be the center of activities for a given area. These stations are equipped by men and means to carry out experiments in the proper way. It is better to have one man dedicate his entire time to this phase as it is done at New Brunswick, N. J. This arrangement is due in no small measure to the New Jersey Greenkeepers association, whose persistent efforts, together with those of the Green section, induced members of their clubs to form a committee to ask and get an appropriation of $5,000 a year from the New Jersey legislature. It was given with the understanding, of course, that anyone wanting information on turf production, whether it be the lawn of a lowly cottage or a broad-acred mansion, they could have it.

Nearly all the experiments on grass at the present time are from one angle only, that of sowing different grasses on the untreated soil of the station at which they are being tried, then using different topdressings and fertilizers after the turf is established. This is a process that no golf course constructor of experience would attempt were he to build a golf course in the vicinity. He would at least use a given quantity of manure or fertilizer, or both, to the acre on the fairways, and use a greater degree of care in the preparation of the seed bed for the putting greens. It seems that these investigators would aim nearer the goal if they, too, would extend their experiments to the preparation of the soil in different ways before sowing rather than keep on with a lop-sided investigation, trying to get results from methods not used in actual practice. There are three to four thousand greenkeepers in America. It is doubtful if there are any six who use precisely the same methods in course upkeep. In other words, there is no school of greenkeeping in the sense that exists in trades, professions or arts. For instance, the way bricklayers, carpenters, plumbers, doctors, dentists, etc., go about a given

problem in their respective lines will vary very little over the length and breadth of the land.

There is no reason why greenkeeping practice cannot be made uniform in the different localities. There must be a best possible method. Therefore, if the Green Section is to remain and extend as a factor in the life of American golf it will have to co-ordinate all these agencies.

Green Section Tells His Policy and Performance

(Continued from Page 43)

that time, it is doubted that most greenkeepers were aware of the existence of an agricultural experiment station at New Brunswick. The valuable aid of the New Jersey Greenkeepers’ association in securing the state legislature’s appropriation was forthcoming after the turf work had been under way for some time and it was plainly evident that more money was needed.

Regarding the comment on the soil employed for the section’s experiment, it must be admitted that criticism is not sound when one understands that research has repeatedly demonstrated that treatments which remedy disorders in the poorest soil will work on the best soils where such problems are minor in comparison.

In substance, the above represents a Green section advocate’s answer to the Riggs-Miller statement, and in it there are several illuminating paragraphs that may help a lot to get the Green section and greenkeepers working as a happy and effective tandem. By all concerned, it is a consummation devoutly to be wished.

Budd Blades

Grind mowers for the last time this Spring. Install Budd Blades when you overhaul and grinding will be a thing of the past. Easier running and a better cut, too. If your supply man will not furnish, write us.

SALES FORCE AND FACTORY EXECUTIVES
Vulcan Golf Company, Portsmouth, Ohio

Left to Right: First Row—Russell Mattern, Philadelphia; H. L. Winkler, Washington, D. C.; Edward Blakeley, Birmingham, Ala.; W. E. Hoyt, Columbus, Ohio; Don Bush, New York City.

Center Row—K. H. Hanks, Kansas City, Mo.; J. H. LaSance, Los Angeles, Calif.; H. J. Nichols, Advertising Counsel; Virgil Motz, Dallas, Texas; N. E. Brainard, Fort Wayne, Ind.

VULCAN GOLF CO. of Portsmouth, O., assembling its golf salesmen for its annual sales conference, held this time Jan. 30, 1929, at the factory, confidently gazed at the prospects for 1930, planned the plays, went over the signals and called it a good day. Reports from the Vulcan salesmen indicated that whatever moaning or alibiing is being done by other fields about the market crash as an adverse factor in 1930 businesses doesn't hold good in the golf market. California and Florida pros should be the first to keenly feel any slump resulting from the market, but in these sections this fall and winter Vulcan business has been far greater than ever before, with re-order volume at a good gait.

In other sectors the Vulcan business for 1929 was reported as highly satisfactory and the organization feels that it has built a satisfying foundation for pro business. The new line Vulcan presents for 1930 made its bow at the meeting.

B. R. Gibler, general manager of the company; A. L. Mercer, president of the parent corporation; C. E. Dowling, purchasing agent; Treasurer Van Camp, Production Supt. Brunson, and H. J. Nichols, advertising counsel, were featured speakers at the meeting and at the annual banquet which concluded the session.

When a newspaper advertises its golf news in the advertising business magazines as an indication of how the newspaper stands with the real buying power of the community it is a hopeful sign that golf is due to come into its own in publicity. The Boston Evening Transcript, advertising in Printers' Ink, features Linde Fowler golf news as a significant detail of the paper's interest to the reader who is a real buyer.

"A natural lake of clear water on a golf course is a thing of beauty. An artificial pond of muddy or stagnant water is an abomination. Dam the architect, but not the streams which go dry in summer."—
