Use of benomyl to control dollar spot

The effectiveness of a new systemic fungicide, benomyl (methyl 1-(butylcarbamoyl)-2-bensimidazole - carbamate), for controlling dollar spot (Sclerotinia homoeocarpa F. T. Bennet) was compared with mercuric chloride in this study. The standard recommendation throughout Australia for controlling dollar spot from the three fungicides showed approximately 97 per cent control with the three ounce rate of benomyl, 94 per cent control with the 1.5 ounce rate of benomyl and 65 per cent control with the two ounce rate of mercuric chloride. The author reported that the benomyl appeared to have an eradicant action on the dollar spot disease as well as a longer residual effect than other currently available fungicides.

No visible phytotoxicity to either the Penncross creeping bentgrass or New Zealand colonial bentgrass was observed from the benomyl applied at either rate. Actually, turf receiving the benomyl application showed improved color, giving the impression that it was stimulating growth. In contrast the two ounce rate of mercuric chloride caused discoloration of the two bentgrasses for an indefinite period of time following its application.

Comments: Dollar spot is a major turf disease in Australia, especially bowling and golf greens. Its occurrence was first recorded from Queensland in 1934. Mercury and cadmium fungicides have been the standards for effective control of dollar spot throughout Australia. Recently, mercury and cadmium have not been as effective in controlling dollar spot disease under certain conditions. The author gave no reason for this development.

The experiments reported in this paper demonstrate that benomyl provides good control of dollar spot without causing discoloration of the turf. Also, this systemic fungicide (Continued on page 35).
Get the pipe that eliminates winter rules ...in the summer.

The strength and versatility of cast iron pipe can easily become your most valuable asset.

Even if yours is a four-season course, rugged cast iron pipe can handle the hazards. Such as water hammer, higher and higher pressures, heavily laden maintenance vehicles.

And if you're planning a revamped look for your course, cast iron pipe makes it easy. Dig it up. Move it around. Reuse it. Expand the system to suit your new layout. Add sprinklers when and where you want them—cast iron pipe takes quick, clean, leakproof taps with strip-proof threads...and no water hammer hazards.

As for long life, would you settle for a century (or two) of service? That's how long corrosion-resistant cast iron pipe has been reliably delivering water to hundreds of cities and towns nationwide.

Get set for season after season of worry-free watering. Install cast iron pipe.

Write for your free copy of Booklet A-27, "Golf Course Irrigation." It's packed with design and installation tips and helpful planning guidance.

CAST IRON PIPE RESEARCH ASSOCIATION • Executive Plaza East 1211 West 22nd Street • Oak Brook, Illinois 60521

An association of quality producers dedicated to highest pipe standards through a program of continuing research.

THE MARK OF PIPE THAT HAS SERVED OVER 100 YEARS IN OVER 100 CITIES

ALABAMA PIPE COMPANY • AMERICAN CAST IRON PIPE COMPANY • CLOW CORPORATION • GLAMORGAN PIPE & FOUNDRY CO. • LONE STAR STEEL COMPANY LYNCHBURG FOUNDRY COMPANY • McWANE CAST IRON PIPE CO. • PACIFIC STATES CAST IRON PIPE CO. • UNITED STATES PIPE & FOUNDRY COMPANY

The Famous Red Rider

the most-proved, most dependable turf work cart in the land—has been joined by America's best known turf birds... the LARK, HAWK, CHICKADEE and GOLDEN EAGLE... the finest sprayers and equipment ever to go to work on a golf course. Here's the first team of the turf... ready to go to work for you!

Smithco Sprayers formerly manufactured by Thuron.
10 BLADE HIGH SPEED REEL: For the finer groomed creeping Bent in the North and the new improved fairway Bents and Bermudas in warmer climates.

EVEN DISTRIBUTION OF CLIPPINGS: With new scraper-deflector, grass clippings are evenly distributed, eliminating bunching, dropping and windrowing.

PREVENTATIVE MATTING AND THATCH CONTROL: Presents a preventative control of thatch and matting by cutting as low as 3/8 inch with a ½ inch frequency of cut.

ELIMINATES SCALPING ON MOUNDS: The 26 inch cutting swath of each unit gives greater flexibility. No “ribbed appearance:” Smoother, more uniform cut.

AVAILABLE in Hollow Roller or Rear Wheel Drive. 3, 5, 7 and 9 gangs.

Gives Putting Green Appearance to Fairways, Aprons and Tees!
Practically all turfgrass fungicides which have been used in the past are of the non-systemic type. That is, disease control is achieved by killing the spores, mycelia, and sclerotia present on the turfgrass surface at the time of fungicide application and by killing inoculum which is subsequently deposited on the turfgrass surface during the active residue period of the fungicide. Thus, effective control by a non-systemic fungicide is only achieved on those plant parts to which the fungicide is applied and only for the period of time that the fungicide remains on the plant surface in an active state. In contrast to this, a systemic fungicide is absorbed and translocated throughout the plant. It can eradicate fungi which have already infected the host plant and can also prevent subsequent infections by the pathogen. A systemic fungicide is preferred to a non-systemic type providing the disease control is comparable and there is no phytotoxicity to the turfgrasses. Benomyl is a systemic fungicide which fulfills these criteria along with a longer residual on turfs. No doubt, the future trend in turfgrass disease control will be toward the use of systemic type fungicides as they become available.

Various methods of paraquat application for the control of annual bluegrass were evaluated in this study. The experiment was conducted under greenhouse conditions utilizing annual bluegrass turfs grown in individual pots. Treatments consisted of (a) time of application—8 a.m. versus 8 p.m.; (b) rate of paraquat application—0.25 versus 0.5 pounds of active ingredient per acre; (c) rate of surfactant—included none versus 0.001 per cent and (d) rate of water utilized—comparing 40, 80 and 120 gallons of water applied per acre. The per cent control of annual bluegrass was determined seven days after the paraquat application.

The best control of annual bluegrass was obtained by applying paraquat at the rate of 0.5 pounds active ingredient per acre along with a surfactant in 40 gallons of water. The 0.25 pound per acre rate of paraquat applied in 40 gallons of water with a surfactant gave more effective annual bluegrass control than the 0.5 pounds per acre rate applied without a surfactant. Forty to 80 gallons of water per acre was the optimum amount of carrier for paraquat applications. The degree of annual bluegrass control was not affected by the time of application when the 8 a.m. “day” treatment and the 8 p.m. “night” treatment were compared.

Comments: Paraquat provides a contact nonselective post-emergence type of weed control. A contact herbicide kills only those plant parts or living cells to which the chemical is applied. The death of the plant occurs very rapidly after application. A nonselective herbicide kills all plant species or plant parts which the chemicals comes into contact with, regardless of whether desirable turfgrass species are present.

When you put in something as critical as underground sprinkling, you get only one chance to do it right. And on hundreds of courses since 1961, that has meant Toro equipment. Toro's Vari-Time* Control System has set the standard.

We've been leaders in sprinkler head design for years. The first Valve-In-Head, the first sealed gear drive, the first 2-speed heads for fairways and greens. A few reasons great championship courses are choosing Toro.

Our equipment costs about the same as other brands cost.

Toro. Because you only do it once.
Because of better design, ours saves money over the long haul. With a Toro Central System, you control the entire course from one location. Make instant changes in your program as the weather shifts. Savings on labor costs can be dramatic. Water efficiency is maximized.

Soggy turf and puddling are virtually eliminated.
Let us help you build and maintain the kind of turf you've been dreaming about.

TORO
We Take Care

A Toro Vari-Time® Central Control System keeps the turf here at Oak Ridge Country Club and over 300 courses installed in the last two years.

RUGGED!
RAPID!
That's RYEGRASS

Versatile Oregon Ryegrass is something to consider for use on any greenway. It's rapid! Both Annual and Perennial Ryegrass will normally germinate in a matter of 6 to 14 days. Because of this seedling vigor and its ability to stand up under heavy traffic once it is established, Ryegrass is a fine performer in problem areas. Ryegrass also does an excellent job of stabilizing soil in disturbed areas. Annual Ryegrass is, of course, a prime ingredient in overseeding mixtures for its early strength. Both Annual and Perennial Ryegrass develop a strong root system which holds moisture. For any greenway, remember Oregon Ryegrass.

BRING YOUR STORAGE SPACE UP TO PAR with Utilicon
...the new, multi-purpose utility building by Conrad

Ideal storage for golf carts, green equipment and all maintenance supplies. Utilicon provides clean, dry, safe storage all year 'round. Rent to your customers for convenient, private storage of carts, clubs. Heavy gauge, overlapping roof and side panels make Utilicon the strongest, sturdiest building of its kind you can buy. Made of all galvanized metal . . . won't rust. Features full 7½' x 10' floor space, 70” entrance, 7½' height. Big 57”, free-sliding double doors (available on end for golf carts). Available in tan, white, maroon and blue-green. All bolted construction makes Utilicon easy to assemble.

Send coupon to Conrad, Inc., Dept. GD-2, Houghton, Iowa, 52631 for complete information and name of nearest dealer. Dealer inquiries invited.

A surfactant is a surface active agent which increases the ability of a liquid such as water to moisten a solid substance such as a plant surface. Basically, a surfactant acts by modifying the surface tensions which exist between water and plant surface. The resultant net reduction in inter-facial tensions causes improved wettability.

Contact herbicides such as paraquat are most commonly used on turfgrass areas for complete kill or "burn off" of the turfgrass shoots and above ground plant parts of weeds just prior to renovation overseeding. Paraoquat has proven to be one of the better contact herbicides for the nonselective control of weedy turfgrass vegetation. In the case of annual bluegrass, kill of individual plants is more complete than with the other commonly available contact herbicides. In using paraoquat, one should be aware that it can move laterally from the area of application in surface drainage water and thus cause kill to adjacent vegetation where a direct paraoquat application has not been made. This most commonly occurs for a 14-day period following application when an intense rainfall or when irrigation has occurred.

This paper summarizes results from seasonal population studies and insecticide control experiments with southern chinch bug (Blissus insularis Barber) on St. Augustinegrass turfs.

Studies conducted over the growing season showed that a major population build-up began during the latter part of March and declined substantially during late October. Two distinct generations of the insect developed in early May and late July. Although the nymphs were difficult to see, they constituted the dominant portion of the population counts made. In contrast, the active crawling adults were readily visible, particularly in turfs which had been severely damaged during the late summer period.

One type of “water hazard”
Certain-teed pipe can eliminate!

Scorched, hard greens and fairways don’t make for great golf games. An irrigation system can solve the problem.

There are two very important things you need to keep in mind when you plan an irrigation system. 1. Find a good contractor. 2. Use Certain-teed Pipe. Why Certain-teed? For one thing, we make both asbestos-cement and polyvinyl chloride pipe—A-C for large diameters and PVC for small. A-C and PVC pipe are compatible with one another and with other piping systems—tying in with old systems or expanding the system in the future present no complications. Certain-teed PVC pipe is white—white pipe is more dimensionally stable than colored pipe and easier to handle on the job. Our PVC pipe offers the design flexibility of either using a deep-socket solvent weld joint or a unique leak-proof gasket coupling. Furthermore, you get the whole system from one source—deliveries are coordinated and everything works together.

When it comes to an irrigation system, remember the two important points: 1. Get a good contractor. 2. Look for the bid that specifies Certain-teed pipe.

Three granular insecticides plus an untreated check were evaluated for the control of southern chinch bug. The three insecticides used were diazinon, ethion and Akton. All three were applied at the rate of four pounds of active ingredient per acre. The turf received an extended irrigation following the application. The insecticide treatments were made in mid-June. Dursban was also included in a comparable, second study.

The diazinon, ethion and Akton provided southern chinch bug control for a period of two months. In addition to utilizing an insecticide, the authors stress the importance of good turfgrass cultural practices in reducing the damage to turfs because the pests appeared to attack turfs which were in a more weakened condition.

Comments: The southern chinch bug is thought to have been introduced into the Whittier area of Southern California in 1967 and has subsequently become a problem on St. Augustine-grass lawns in that area. The southern chinch bug develops from white, translucent eggs having a red spot. The immature nymph stages have two distinct colorations: the earlier instars are brilliant red whereas the last instar is distinctly black. The adult, crawling form of the insect is of two distinct types. There are long-winged and short-winged forms: both are black with white wings.

Damage caused by the southern chinch bug appears as large irregular yellowish to brown patches. Detailed examination of the damaged area frequently reveals large concentrations of the insect which feeds by sucking juices from the turfgrass plant.

Diazinon and ethion, both organic phosphates, have proven quite effective for chinch bug control over the years. In utilizing these materials, one should be aware that the former has a comparatively high human toxicity rating whereas the latter ranks as comparatively less toxic. All insecticides should be utilized judiciously as needed to control a potentially damaging insect infestation.
