Electra 72 has a greater range than any other golf car in the U.S.

Need proof?

Electra 72 challenges any make to a race around any course in the country. In fact, it will take on all 12 leading makes at once!

When the others have died somewhere between the 18th and 54th hole, Electra 72 will still be going strong.

Then, with a quick 45-minute charge stop, it will be back on the green for another 54 to 72 holes while the others will be out of commission for 8 hours.

The secret?

Electra 72 is the only golf car with the tri-polar, lead-cobalt battery that beat all comers at the 1971 Intercontinental Clean Air Car Race.

For complete details, contact:

*4-wheel model also available

**Convertible to 4-passenger personnel carrier
1. **REAR WHEEL DRIVE**

Roseman Rear Wheel Drive permits overhanging of traps and bunkers and trimming close to trees, no side wheel marks. Laminated puncture-proof tires overcome objectionable bouncing of pneumatic tires. The caterpillar-action of laminated tires give non skid traction, making it possible to mow heaviest turf growths. Rear Wheel Drive available in Rough or Fairway mower.

---

2. **REASONS ROSEMAN IS FIRST IN MOWING PERFECTION**

2. **HOLLOW ROLLER DRIVE**

Roseman Hollow-Roller mowers place less weight p.s.i. on turf than any other type. Less compaction results. Hollow drum design permits mowing on soft or sandy soils and on wet fairways with no wheel marks. Improved turf, better playing surfaces and finer finished cut result. All putting greens are cut with rear roller drive mowers. Why not give your fairways putting green treatment?
item of basic data needed is clearly reproduced on the slip, particularly the customer’s account number.

- Tolerating too many returns for credit to account. Every such action does away with profit on the given sale than the original charge.

- Credits are made for larger amounts handling the transaction. Frequently and increases the chance for error in such.

- Tolerating too many returns for credit applications or credit absues have eaten heavily into the profits of any business. The sysystem which fails to immediately point out existence of shaky credit condiitions is inadequate. Without such workable credit records and systems all other safeguards can prove inadeqquate. They have done just that for virtually every one of the business failure referred to above.

Preventive: Require the original charge slip to accompany each returned item.

- Accepting partial payments on accounts month after month. This often leads to a dangerously large balance which the customer cannot pay and jeopardizes his heretofore rating.

- Granting requests for larger than authorized amounts of credit. This was usually done for a good customer of long standing as a special favor.

- Without exception, granting the request should be delayed long enough to check on the reasons behind it, the ability of the customer to pay the larger sum and for any change in the financial capabilities of the account.

- Checking only one credit reference. Many substantial losses were noted where only one reference was required on credit applications or only the first was checked even where more were listed.

Preventive: Check all references and require at least three from every applicant.

- Over-zealous urging of customers to use their credit. The drive for additional business can never be discouraged in any business operation, but when such activity is obtained on a basis of credit where it’s not justified, it usually costs more than the profit made.

Preventive: (a) Discouragement of high pressure methods resulting in customer’s over-using his credit beyond his ability to pay; (b) holding fast to all credit rules in periods where special business promotion activities are underway, and (c) setting up of separate credit facilities for use at such times.

- Failure to pursue conventional collection steps for fear of losing a good customer. Almost every business failure revealed the presence of such procedure. An uncollectable account is certainly anything but that of a good customer.

Preventive: (a) Following through on a standard policy of handling credits and collections with no variance for any but emergency considerations; (b) realization that the good customer whose account had become hazardous has lost that status and handling it accordingly.

- Finally, the lack of proper credit and credit control records has always been a contributing factor where credit absues have eaten heavily into the profits of any business. The system which fails to immediately point up existence of shaky credit conditions is inadequate. Without such workable credit records and systems all other safeguards can prove inadequate. They have done just that for virtually every one of the business failure referred to above.

The easiest way to wreck a golf club is leave too many stones unturned.

Nothing turns a golfer off quicker than ruining his clubs on fairway stones. Nothing kills play on a golf course faster than unhappy golfers with damaged woods and irons.

That's why the fast and efficient Bergman Method of golf course preparation plows deep; turns and returns the soil to bring rocks and debris to the surface; rakes and picks the stones before leveling, contouring, fertilizing and seeding, including tees and greens. Naturally we can also install your irrigation system at the same time or serve as your consulting supervisor.

These are the reasons why Bergman Method golf courses are played by more enthusiastic golfers sooner . . . why “stony” is the description of a beautiful approach shot and not a criticism of the condition of the course. And because we are a “family” company, your golf course is assured of tender, loving care.

We go anywhere

Food operations at many golf clubs are barely self-supporting, much less profitable. Much of the blame for the economic blandness can be traced to a menu that is too elaborate for the size and type of food operation. The kitchen, which is directly affected by the kind of menu it must support, is over-equipped and over-staffed. Both conditions result in large quantities of leftovers and slow service.

Preparing leftovers for the next day’s menu ties up kitchen labor. Serving leftovers lowers the quality of food and lowers the selling price; for example, roast made into stew. But the cost of labor and the cost of food remain the same—high. All of these conditions narrow the club’s profit margin.

The menu, then, is part of the key that can solve the multiple problems of food waste, slow service, too much kitchen equipment and over-staffing. The menu is a one-sided contract between customer and club. The customer has the right to expect everything that is listed on the menu. The customer also has the right to a fair choice of quality food that is well-prepared and served with personal attention. The carefully planned, simple menu, offering limited daily changes, assures that right.

The club also gains. A simple menu saves time, labor and cuts down on less profitable leftovers. The members find dishes they like easily, the waitress or waiter can take and place the order quickly, and the kitchen can handle the work load with less staff and less equipment in less space.

Perhaps the word simple is a misnomer. It does not mean offering only one type of food. Within its context, variety can be achieved if the club takes advantage of modern methods of preparing food. For example, cooked-to-order items can be readily offered and in greater variety, because pre-cut and portion controlled foods—steaks, chops, cutlets and kebobs—are now available.

Simple also means using modern food merchandising techniques. In fact some successful food operations have all but eliminated the menu because they display the food. This technique is particularly effective at lunch time or when broiling steaks or carving prime ribs in the dining room at dinner. It also cuts down on the high cost of labor.

**Kitchen equipment**

There are many claims about how the many new and different kinds of equipment and types of fuel save labor. In my opinion, the following have proven truly labor saving:

- Pass-through cooling units or refrigerators;
- Convection and revolving ovens. They save fuel, labor, but above all, they roast and bake uniformly;
- Automatic dishwashers. They are sanitary, save labor and cut down on breakage;
- Microwave oven is a handy auxiliary unit in the standard kitchen;
- Steam. It is an important heater, cooker and cleaner.

**The kitchen**

A simple kitchen is not necessarily a small kitchen. When planning the kitchen layout, consideration must be made for the worker. He needs elbow room and humane working conditions. At many clubs kitchens are still being built that imitate hotel kitchens of a generation ago. The reason for this state of affairs is, again, the existence of a menu that is too elaborate and concepts that rely on outmoded ways of preparing food and types of equipment.

In short, today’s approach to food operations is to set a policy on the menu and type of service first, then plan the kitchen layout to complement that policy.

There is no standard kitchen layout suitable for every club. But some basic principles should be used as a guide when planning a new kitchen or redesigning an old one.

The modern kitchen has a natural flow of traffic with little or no backtracking. Men and materials arrive and check in at one control point. The time clock and receiving areas are also usually located at the control point. From here personnel can get to their respective locker rooms. The linen room is close by. Dry goods go to the store room. Meat, produce and dairy products are stored in the various refrigerators and deep freezer units. Pre-preparation and cooking areas roll toward the short order cooking and dish-out end of the kitchen, where the waiters and waitresses can pick up the finished product. The dishroom and silverware washing area are also located

KITCHEN  from page 87

near the pick-up area.

Special attention should be paid to the food service pick-up area. In most kitchens the waitresses or waiters place the order and wait until the cooks and pantry girls put the order in front of them. The modern method relies on self-service. Items are prepared, ready-to-pick up. Not only water, ice and coffee should be ready, but milk, juice and other appetizers, such as salads, desserts, soups, and even some vegetables or entrees that are suitable for pre-dishing (pies and casseroles), should be ready.

In the pantry the use of pass-through cooling units with sliding glass doors, speeds up service. The waitress or waiter can pick up grapefruit, cantaloupe or salads, while the pantry girls replenish.

The hot food dishout and steam table is designed to permit team work and for self service. The waitress or waiter, having access to soups and vegetables, can also garnish steaks or fish with watercress or lemon.

All kitchens need ranges, broiler ovens and steam kettles, but the modern kitchen uses less of these. Generally, home butchering is out, and in smaller operations the pastry shop has been eliminated, saving from 10 to 20 per cent in space and equipment. Once the pre-cut and portion-control system has been adopted, fewer steam kettles and stock pots are needed. Even the various pre-prepared soup and gravy bases replace the eternal stock pot and espagnole.

To sum up, when planning a kitchen, begin with the menu and type of service. Decide on home butchering versus pre-cut and portion-control meat and ready-to-serve cakes and pastry. Offer simple, but effective menus. Display food where feasible. Pay special attention to the food service and pick-up area and purchase equipment that have proven their value.

A golf club in which the food operation is outstanding and self-supporting grows and is a valuable asset to its members.

Matthew Bernatsky, professor emeritus, retired in 1971 as a professor at Cornell University's School of Hotel Administration. A well-known lecturer, he has appeared at Club Managers Assn. of America seminars and is celebrated for his designs of food service facilities at many restaurants and country clubs throughout the country.

CHEMICAL  from page 57

consequently healthier turfgrass reduces weed growth and even aids fungus resistance.

Fred V. Grau, president of Grasslyn, Inc., a former director of the USGA Green Section and a columnist for GOLFDOM, agrees that better turfgrass management practices—liming, fertilization and watering gauged to prevailing conditions—can offset the losses caused by prospective pesticide regulation. Rees Jones sees pesticide regulation as challenge to American ingenuity.

"We're an enterprising people," says Jones. "Some of the younger golf course superintendents sympathetic with the new conservationist movement are voluntarily seeking less hazardous substitutes for DDT and mercury-based fungicides. Grass breeders are producing new disease-resistant grasses. One new variety of bentgrass already appears suitable for use in hot climates formerly limited to bermudagrass putting greens."

American agronomists seem eager to accept new challenges. In Southern California, smog injury to two susceptible varieties of bermudagrass stimulated development of smog-resistant variety called Santa Ana. Writing in the book, "Turfgrass Science," agronomist Coleman Y. Ward blandly accepts smog resistance as merely one more problem for grass breeders:

"...Since air pollution is expected to be a more serious problem in the future, turfgrass breeders will be required to add resistance to the repertoire of turf-quality characteristics now involved in grass-breeding programs."

This spirit seems more than a match for some mild restrictions on pesticide use.

Golf course superintendents and other turf experts throughout the country rely on these outstanding Chemagro Blue Bullseye chemicals to keep their grass in first-class condition throughout the year:

*DYRENE 50% Wettable Powder turf fungicide provides outstanding protection against leaf spot, melting-out, copper spot, rust, Schlerotinia dollar spot, brown patch and snow mold. Will not clog or corrode spray equipment. No unsightly deposit. Will not stain fabric or shoes when dry.

*DASANIT nematicide provides fast contact and long-lasting residual control of nematodes. Merely apply with a granular applicator and drench the soil with water.

*DYLOX 80% Soluble Powder insecticide provides outstanding control of sod webworms. Three spray applications at monthly intervals are recommended.

*BAYGON 70% Wettable Powder insecticide provides economical, long-lasting control of certain destructive insects attacking turf. Sprays are easy to mix and apply.

*DEXON 35% Wettable Powder fungicide is unsurpassed for long-lasting control of Pythium. Will not cause leaf burn when applied as directed. Compatible with other turf pesticides.

Contact your Chemagro supplier now for full information about these time-tested turf chemicals.

Everybody has turf problems.
Chemagro has turf solutions.
