Winter overseeding is getting a better name. The name is Pennfine.

Pennfine fine-leafed perennial ryegrass eliminates problems that traditionally go along with overseeding. Because Pennfine does away with the shortcomings of traditional overseeding grasses.

Matter of fact, in six short years, Pennfine has become the standard on fine golf courses throughout the South.

Pennfine was bred to cut clean and smooth. And when cut to "green height," Pennfine produces extra tillers for an extra-thick putting surface. And Pennfine's resistance to disease and resiliency under heavy traffic gives it the durability of less attractive ryegrasses.

Another Pennfine advantage: It allows a smooth spring transition to bermudagrass.

Write now for more information. Pennfine, P.O. Box 923, Minneapolis, MN 55440.

The best thing growing.

The seed that's changing golf in the South.

We wrote the book.

After fifty years of supplying materials to resurface tennis courts, we finally wrote a book about it. We think it’s probably the most informative document of its kind anywhere.

Our book covers it all. How to make worn courts look and play like new. How to resurface cracked courts with Armorcoat and Laykold. How to transform hard courts into resilient, cushioned surfaces. Even how you can regulate surface speed. And it’s all illustrated with plenty of informative pictures and drawings.

We’ve spent fifty years building tennis courts. In fact, nobody in the world ships more asphalt for tennis courts than Chevron. We’d like to pass some of that expertise on to you.

So we wrote the book. For your free copy of RESURFACING, call Toll-Free/24 hours 800-648-5322 ext. 200. (Good in 48 states except Nevada)

**Superintendents gather at Purdue**

Purdue University's campus provided an ideal setting for the annual Midwest Regional Turf Conference, and the Purdue basketball team’s first National Invitational Tournament game added some extra excitement for the more than 500 superintendents and other turf managers gathered in West Lafayette, Ind., last month.

After an initial afternoon of general topics, the conference was divided for a day into three simultaneous sessions: private golf courses, public golf courses, and lawn care and general turf. The public golf program began on a positive note with old Bill Lyons, owner of Lyons Den Golf in Canal Fulton, Ohio, and vice president of the National Association of Public Golf Course Owners, talking about “care of the golfer.” Probably no one takes better care of his golfers than Lyons — from putting litter bags and towels on every golf cart to providing fresh, cold drinking water on the course to operating a storm alert service during golfing hours — and he presented about two new ideas per minute during his 30-minute talk.

- get your course accurately measured and marked
- condition and equip the course for the ease of players
- make the course enjoyable for women to play
- since a pro shop is essential to the overall atmosphere of a successful golf facility, keep it even if it doesn’t make money
- “strong promotion of green fees is more profitable than trying to promote food sales”
- have “fun” activities, but be sure to explain special rules and handicap methods to participants — don’t assume everyone knows what “best ball” or “Callaway” mean.

In the private golf course session, Kent McFarland of the Indiana Seed Co. explained some of the many changes occurring in turf seed varieties. Among the bentgrasses, in his opinion, McFarland said, Penncross is still the most popular; Penneagle shows promise; and Emerald is next.

Superintendents today have 50 varieties of bluegrass to choose from, McFarland said. Indiana Seed Co. sells 18 varieties — seven “actively.” “Merion, Fylking, and some others are being eliminated by turf diseases,” McFarland said, and are being replaced by new varieties. He named Sydsport, Barron, Adelphi, and Touchdown as the most popular new bluegrasses and predicted that Touchdown would be the best-selling bluegrass in 1979.

“Most of the revolutionary changes in turfgrass lately,” McFarland noted, have been in the perennial ryegrasses. The revolution started with Manhattan in the early 1960s and has escalated in the past year or two, with many fine new varieties just released or about to be.

Of the fine fescues, McFarland said that “we really don’t have any today for fine turf areas. In development, the ryegrasses are supposedly 20 years behind the bluegrasses, and fine fescues are 20 years behind the ryegrasses.”

**Massachusetts’ show draws large crowds**

About 1,350 attendees and 125 exhibitors took part in the 48th annual University of Massachusetts Turf Conference and Industrial Show at Springfield, Mass. in February. The highly attended golf course sessions featured a variety of topics ranging from professional ethics to more technical discussions of topdressing and Poa annua.

Dr. D. Thomas Duff, a professor at the University of Rhode Island in Kingston, discussed his success in developing a sub species of Poa annua which is more perennial than typical Poa, withstands mowing at putting green height, tends to creep, and compares favorably to Poa pratensis (Kentucky bluegrass).

Although Duff did not advocate developing a selection program for Poa annua, he did say it may be time to give poa a “second look.” Instead of trying to come up with a herbicide program that is going to completely eliminate poa,” he said, “if you have the right type you may find you can live with it pretty well.”

An informative discussion focusing on sand topdressing by Dr. Robert N. Carrow, a professor at Kansas State University in Manhattan, was also enthusiastically received by a large number of the attendees.

Carrow said there are many benefits to sand topdressing if it is done correctly, but he warned, “If you don’t do it right, you’re better off not doing it at all.” Carrow said proper topdressing aids in thatch control, creates a better micro-environment for turf plants, smooths the turf’s surface, and can be used to modify the soil surface.

Of all the topdressing mixes (high sand, pure sand, and low sand), the most effective is high sand, according to Carrow. “It has excellent physical properties, fairly good chemical properties, and good biological properties,” he said. High sand mixes contain about 85 to 90 percent sand.

However, Carrow added that calcine clay or expanded shale can be substituted in the mix if sand is not available. “If you can’t get a

When your job is battling tough grass and weeds, you need THE ULTIMATE WEAPON: a WEED EATER brand gasoline trimmer.

Rugged, reliable, and ready-to-go, WEED EATER trimmers have powerful 2-cycle engines and heavy-duty nylon cutting line. So they'll fight your tough cutting battles. Anytime, and every time.

If you're facing heavy brush, or you need to prune vines or tree limbs, reach for Model 698. It has a big 21.2cc engine and two cutting lines. And its straight shaft and gear reduction unit lets you switch from the nylon line head to a metal Tri-Kut™ or sawtooth blade. It's the perfect trimmer for parks, schools, or commercial and industrial areas.

The biggest battles call for the biggest trimmer: Model 657. You can handle any cutting mission with its 85cc engine. It's equipped with a shoulder harness, four-line cutting head and has a metal blade capability.

From golf courses to overgrown roadsides, this trimmer mows down the thickest grass and weeds. Quickly and easily.

So, when you're faced with a tough grounds maintenance mission, get a WEED EATER trimmer: THE ULTIMATE WEAPON. It'll fight all your cutting battles.

Model 609 is lightweight and maneuverable.

When you need a quick clean-up of small areas, use the new lightweight, compact WEED EATER trimmer Model 609. It weighs just 12 lbs., and has a Tap-N-Go™ head that feeds out cutting line when it is tapped on the ground.

Model 698 trims vines and limbs.

Model 657 handles the big jobs easily.

For a full briefing on WEED EATER gas trimmers, write: WEED EATER, Inc., P.O. Box 37347, Houston, Texas 77036.
The three components (sand, said Carrow said the key to good sand go with them, but they are going to be expensive," he said. "The most important change is the addition of another level," he said. "Why not employ turf graduates as golf course workers." The graduates would be given a title, receive more pay, and the type of work they performed would be upgraded. "This solution would provide the golf course superintendent with a reliable labor source and with knowledgeable turfgrass personnel," he said.

If we have fallen short of attracting quality workers and I see little future for the present golf course worker," he said. The reason the industry has failed to attract good employees is because of low pay and a lack of benefit packages, according to Cleaver. "A living wage is an absolute necessity."

Cleaver, who is past president of the GCSAA, said there are two major "challenges" regarding labor in the golf industry: employing the large number of graduates currently being trained by turf schools, and developing a reliable labor force. Restructuring golf course management could be the solution to both problems, according to Cleaver. "The most important change is the addition of another level," he said. "Why not employ turf graduates as golf course workers." The graduates would be given a title, receive more pay, and the type of work they performed would be upgraded. "This solution would provide the golf course superintendent with a reliable labor source and with knowledgeable turfgrass personnel," he said.

**CLUBS & COURSES**

**Private club charges "unfair" competition**

The golf director at a private golf club in Pennsylvania has termed competition from a nearby taxpayer-subsidized municipal course "unfair."

Phil Cassidy, golf director at Westover Inn and Golf Club, West Norriton Township, Pa., said he is losing customers to Jeffersonville Golf Club because he cannot compete with their low prices. "My basic complaint is these people are not charging a fair price," he said. "They charge the lowest rates in the area and are underpriced about $2 from other courses."

Jeffersonville's greens fees are $3 for township residents and $5 for non-residents during the week, while Westover charges $8 to all golfers.

The township used a 35-year, $1.5 million bond to purchase the Jeffersonville course in 1972. According to Today's Post, the local newspaper, under the terms of the bond "West Norriton Township may pay $104,000 annually to its municipal authority, which issued the bond."

Further, "According to township officials, the golf club has never produced more than $85,000 towards the $104,000 and the rest has been subsidized through the township's general fund. In 1978 the township contributed $27,000 towards the bond payment," the paper stated.

Cassidy said the course would not have to be subsidized if it would raise its fees about $1 per round. "About 26,000 rounds are played at Jeffersonville each year and the course has been subsidized about $25,000 per year," he said. "There is no reason the golf course shouldn't break even if they charge $1 more a round. They would also be priced more competitively," he added.

Theodore Heske, president of the township Board of Commissioners, said the primary reason the township purchased the course was to "preserve about 130 acres of recreational land."

"We have no quarrel with Westover. Westover is a private club and their rates should be higher, but we cater to senior citizens, duffers, and people who can't afford higher greens fees," he said. "There's bound to be a difference in price between a Cadillac and a Ford." Heske added that they plan to raise greens fees at Jeffersonville "a little bit" in 1979.

Cassidy is not only displeased with the disparity in golf rates, but also with the tax structure. "We are required to pay a 10 percent amusement tax just like Jeffersonville," he said, "but they get some of the tax money back in...
the form of subsidies to run their courses."

"They're just taking it out of their left pocket and putting it back in their right pocket," Cassidy said. "Technically, they're paying it to themselves. All we want is a fairer tax base or fairer competition," he added.

**PROMOTION**

**Ad agency formed for golf courses**

"When it comes to promoting their product, the golf industry is years behind other fields," according to Gary Brooks, director of Golfpromotion of Limerick, Pa.

Golfpromotion is a new, full-service advertising agency designed to help generate business for public and private golf courses.

"I've never felt the golf industry has gotten any assistance from anyone specialized in promoting golf," Brooks said. "Golfpromotion's goal is to further the sport of golf and the business of golf through the use of modern marketing, advertising, and promotional techniques."

Brooks said response to the agency, which he formed in September, has been encouraging. "I didn't know how well it would be received, but the response has been very good."

There are about 43 public golf courses in the five-county area surrounding Philadelphia, from which Brooks has set up advertising campaigns for ten. He has not yet contacted any private golf clubs.

The agency provides a variety of promotional services including television, newspaper, radio, and direct mail advertising. "Course owners don't have to have a lot of money before we will talk to them," he said. "We can set up an entire campaign for them based on their particular budget."

He added that his fees are "consistent" with those charged by most small advertising agencies ($100 retainer per month plus commission).

Brooks said historically courses have not advertised much and the result is many have no advertising budget. Therefore, at least to begin with, those courses contacted by Brooks have limited themselves to the cheapest advertising technique available, direct mail.

"Our direct mail campaign consists of a discount coupon merchandising program to try and get new people to try different courses." The direct mail campaign may not be the slickest advertising technique, but as Brooks said, "The people involved in golf course advertising have got to learn to walk before they can run."

**SEED**

**Kentucky bluegrass cultivar introduced**

North American Plant Breeders recently introduced a new cultivar of Kentucky bluegrass which is the most disease-resistant variety currently on the market, according to NAPB.

In a number of turf trials the cultivar, named Enmundi Kentucky bluegrass, has proven to be very resistant to turf disease, particularly Fusarium blight and helminthosporium. It has also exhibited excellent resistance to rust and brown patch, according to NAPB.

Studies at Penn State University also indicated that the cultivar performs well under low mowing heights. Limited quantities of Enmundi bluegrass seed are now available in 50-pound bags.

For further information, contact NAPB, Box 2955, Mission, KS 66205.

**MILESTONES**

**Dey honored at architect's meeting**

Joe Dey, a member of the World Golf Hall of Fame, has been named the 1979 recipient of the Donald Ross Award by the American Society of Golf Course Architects.

**Joe Dey: Award winner**

Dey, who has been actively involved in golf for more than 40 years, received the award last month at the ASGCA's annual meeting in Pinehurst, N. C.

The recipient of many golf honors, Dey is a former United States Golf Association executive secretary and former commissioner of the Professional Golf Association's Tournament Players Division.

The award was first presented in 1975 to recognize those individuals in golf who have helped create a greater awareness of the role of golf course architecture in the overall enjoyment of the game.

**RESEARCH**

Too much N can increase winterkill

Heavy applications of nitrogen fertilizer on bermudagrass and St. Augustinegrass in the early spring can increase winterkill and impair the turf plant's ability to survive, according to researchers at Texas A&M University, College Station, Texas.

Researchers studying the root systems of these two grasses have discovered that leaf growth greatly exceeds root production in the first few weeks of "green-up" in late March. Heavy applications of nitrogen, the fertilizer element that encourages leaf production in plants, can worsen the situation and cause the new growth to starve.

Dr. James Beard, agronomist in charge of turfgrass research for the Texas Agricultural Experiment Station, said, "Previous research has shown that excessive nitrogen applications promote shoot growth at the expense of the roots, while increasing potassium fertilization promotes root growth."

"In light of this, delaying nitrogen applications beyond this critical period may prove to be a valuable practice for these two turfgrasses," he added. "On the other hand, early potassium applications may prove to be beneficial."

According to Beard, the delay in new root replacement in the spring is probably a major cause for winterkill and spring dead spot. J. M. DiPaola, an Experiment Station scientist working with Dr. Beard, said, cultural stresses such as verticuting, use of growth retardants, and herbicide and pesticide applications should be delayed until after the root loss period. Water should also be supplied as needed to prevent wilt.

"Raising the cutting height (of mowers), delaying the first mowing, and lengthening the intervals between mowings may all be helpful in minimizing turfgrass injury and stand reductions during this critical period," Beard added.

**CORRECTION**

Homelinks will keep all 18 holes open

Contrary to what was printed in the February issue of GOLF BUSINESS and in other publications, Homelinks Golf Course in Olmsted Township, Ohio, will not close nine of its holes due to construction of cluster housing on the property.

According to Homelinks Manager Al Delmonti, the entire 18-hole golf course will remain open for the next 100 years," even though construction of condominiums around the course is "contemplated."

Homelinks was one of six Cleveland-area courses which were said to be threatened by construction of housing developments on all or part of their land.

Yet another course, Parkway Country Club, located just a few miles from Homelinks in North Olmsted, already has concrete streets for fairways and model homes instead of tees and greens.
With the lightweight Master Glide IV, Harley-Davidson proves that prestige and common sense go hand in hand. For, along with comfort, you get Master Drive, our exclusive electrical system that saves power and money.

How? Conventional electric cars have batteries set up in series. They constantly draw full power regardless of speed. Master Glide IV, however, has our unique, two circuit system. It switches to parallel operation at low speeds, cutting power use, and waste, in half. That means significantly increased battery life.

A simple, common sense idea. Multiplied by a 30 car fleet, just simple enough to mean thousands of dollars in yearly savings.

For details on Master Drive, self-adjusting brakes, and our extended warranty on key electrical components, see your local Harley-Davidson dealer. Notice we said “dealer”, not “regional sales office”. The distinction will be clear when you need quick service or advice on anything from parts availability...to fleet planning and financing.

Write Harley-Davidson/Golf Car Div. PO. Box 653, Milwaukee. Wisc. 53201.
I could sure use a rugged mid-sized rotary that really maneuvers.”
