Renovation in progress.

Now you can renovate your fairways in days—while your golfers keep playing.

Just apply Roundup® herbicide to your weed infested fairways. While Roundup goes to work, golfers can keep playing right over the treated turf. And you can reseed right through the dying grass just 7 days after applying Roundup. Re-infestation from weed roots won’t be a problem either, since Roundup effectively controls the root systems of treated weeds and grasses. Yet Roundup is inactive in the soil, and won’t move out of the treated area to injure desirable vegetation. You can even use Roundup to control weeds around greens, for general cleanup, in and around sandtraps, along fence lines, even around the clubhouse and tennis courts.

See your chemical dealer soon for your supply of Roundup. It can make fairway renovation and golf course weed control fast and efficient for you, and leave a lot more playing time for your golfers.

Nothing works like Roundup.

No part of this publication may be transmitted or reproduced in any form or by any means, electronic or mechanical, including photocopy, recording, or any information storage and retrieval system, without permission in writing from the publisher. Address: 7500 Old Oak Blvd., Middleburg Heights, Ohio 44130. Subscriptions sent free to qualified management personnel at golf facilities. All others, including elected club officials: $18 per year in U.S. and Canada; foreign, $24 per year. Single copy price: $1.50. Send subscription requests and change of address notice to above address. Second class postage paid at Cleveland, Ohio. Postmaster: Send Form 3579 to GOLF BUSINESS, Circulation Dept., 7500 Old Oak Blvd., Middleburg Heights, OH 44130.

FRONT COVER: Our feature this month is moisture sensors. A new, impedance-type, electronic probe and hook up is shown.
Arnold Bruns has joined the staff of the Pinehurst CC as head golf course superintendent. Bruns moves to Pinehurst from Fair Oaks CC in San Antonio, Texas, where he was superintendent for three years. He was also superintendent at Pharoahs CC in Corpus Christi for three years and Great Hills CC in Austin for two years. Bruns has been a member of the Texas Turf Grass Association for the past 20 years and was one of the founders of the Central Texas Golf Course Superintendents Association. He has also been a member of GCSSA for 20 years. He will direct maintenance for Pinehurst's six courses, a total of 108 holes.

H.G. Nordmann, Jacobsen Vice President, Controller, will be acting General Manager for the Jacobsen Division of Textron Inc., following the resignation of Thomas Bruns, President. Bruns left to assume a position in another company, according to Egil G. Ruud, Group Vice President, Textron.

David Volkmann, former customer service specialist in manufacturing at Mallinckrodt, Inc.’s St. Louis plant, has been promoted to customer service coordinator for the specialty chemicals division. Volkmann joined Mallinckrodt in June, 1972.

Terry Brady was recently appointed field service manager for the Western Turf Sales Division of the Rain Bird Sprinkler Mfg. Corporation, according to Turf Marketing Manager Rex Dixon. Brady will be responsible for all field activities relating to Rain Bird Western sales.

Denver Brass & Copper Co., Denver, Colorado, and a French firm, Cogefrance, Paris, have been named co-winners of the Distributor of the Year award from the Weather-matic Division of Telsco Industries. The winners were announced during the recent sales meeting at Rancho de los Caballeros in Wickenburg, Arizona.

Howard Rotavator Company in Harvard, Illinois, has appointed Chris Burden to the Position of Director of Marketing Services, and Clyde Morter to Marketing Manager.

The Heckendorn Corporation, Cedar Point, Kansas, is a new distributor for Sensation’s full line of lawn maintenance equipment for the states of Kansas and Oklahoma.

William Fletcher has been appointed engineering manager for Telsco Industries. He will direct Telsco’s new products research and development program, as well as supervise engineering activities to improve current product lines.

Ms. Kelli R. Sneed, a junior at Texas Tech University in Lubbock and a major in Landscape Architecture, has been awarded a $500 scholar ship grant given by Weather-matic Division of Telsco Industries.

Better irrigation

Rancho California was built around its irrigation and drainage system. The course was built for maintenance and golfers who shoot between 85 and 100, although it has a USGA rating of 72.2. Valcon, new all-fiberglass, controllers are used for the irrigation system. (Featured next month in New Products.) The system is programmed to run for six minute cycles, four times a day. This method of watering has realized a 20 percent water savings for the course, with no runoff and good infiltration. Hearsh reports that Poo annua is reeding, due to the rootzone watering technique and that the Pennfine on the course is getting thicker with deeper roots. GB
Introducing our all-new golf car batteries.

We've gone to great lengths to make sure they'll go the distance.

Longer.

All golf car batteries look alike on the outside, but inside there's a big difference. This year, we completely redesigned and improved our Action Pack electric vehicle batteries. To give you more mileage, longer life, and an even better value for your battery investment.

No course is too tough for them. Heat and hills are no problem for these batteries. They'll take everything your course and Mother Nature can dish out. And bounce back to maximum available capacity, charge after charge. Round after round.

Our secrets of longevity. Inside, we gave our batteries new PVC fiberglass mat separators for greater service life and less internal resistance. Thicker plates and high-density oxide for improved cycle life. Increased electrolyte above the plates, to reduce the chances of low water-level failure. And unique grid-alignment lugs that lessen the possibility of premature shorts.

In all, they're the longest lasting 6-volt electric vehicle batteries we've ever made. And further proof that at Gould, up to par isn't good enough.

Committed to making batteries better than ever.
LONG-LASTING  CHIPCO® 26019 IS  STRONG MEDICINE.

If you're serious about protecting your turf against diseases, give it your best shot. Spray Chipco 26019 fungicide. Thousands of superintendents have switched to Chipco 26019 in the past two years.

And no wonder. Chipco 26019 gives you the longest residual. You can cut the number of sprays in your program, and that cuts your costs. And Chipco 26019 prevents the major turf diseases with unsurpassed effectiveness. You'll get good results with Chipco.
Chipco 26019 also suppresses grey and pink snow molds. Ask your Chipco distributor or Rhône Poulenc representative about effective, long-lasting Chipco 26019... the strong medicine in turf disease prevention. Rhône Poulenc Chemical Co., Agrochemical Div., Rhône Poulenc Inc. Monmouth Junction, NJ 08852.
PUBLIC COURSES

Top fifty U.S. public courses named by Golf Digest

Golf Digest's first ranking of America's 50 Greatest Public Courses was announced in the magazine's March issue. The top ten are: Brown Deer Park GC in Milwaukee; Cog Hill GC in Lemont, Illinois; Edgewood Tahoe GC in Stateline, Nevada; Indiana Canyon GC in Spokane, Washington; Otter Creek GC in Columbus, Indiana; Plumas Lake G&GC in Marysville, California; Tanglewood GC in Clemmons, North Carolina; Torrey Pines GC (South) in La Jolla, California; Wailua GC in Kauai, Hawaii; and West Palm Beach GC in West Palm Beach, Florida.

Twenty-nine states have courses on the list. The states with the most courses represented are California with six and Florida with four. A complete listing can be found on page 67 of the March issue.

The authoritative rankings are determined by the sectional executive directors and secretaries of the PGA of America, the executive directors of 51 state and regional amateur golf associations and members of the USGA's two public links committees.

PRIVATE CLUBS

Congressmen to speak at NCA Legislative meeting

The Hon. John M. Ashbrook, (R-OH) ranking minority member of the House Committee on Education and Labor, will speak during an afternoon session of the National Club Association's (NCA) Legislative Conference and Annual Meeting on May 19 in Washington, D.C. The session is devoted to a study of the recently signed Labor Department regulation banning federal contractors from paying employees' dues and expenses in organizations with selective membership policies. John Tysee, Director of Labor Law for the U.S. Chamber of Commerce will also be participating.

Representatives from the Labor Department are expected to be present for the discussion of that regulation, which was frozen by President Reagan until March 30.

On a recent flight from Cleveland to Atlanta, I had the occasion to ask a question of my golf playing seatmate, "Who's your golf course superintendent?" He thought for a moment and then replied with the same answer I had received from 21 previous golf playing seat-mates, "I don't know."

Twenty-two responses to the same question over a period of three years does not make a survey; but it can be food for thought when thinking about your image and visibility as a golf course superintendent. As the 1981 golf season gets into full swing, let's think about ways to use more public relations in our golf course maintenance operations. With some planning and time, each superintendent can enhance his own image and better educate the golfers to the important role of the golf course superintendent.

There are several suggestions which can help develop a better image, and build a better more informed golfing public, at your course or club. Have you ever considered having an open house in the maintenance building? Before you pass by this suggestion, give it some consideration. There are more people interested in knowing what kinds of equipment and products you use than you might think. How many club members or regular course players do you know that have an understanding of what you do and what it takes to maintain the course? Giving them the opportunity to find out at an open house can begin the process of educating them to a maintenance point of view. Is your maintenance area too messy and dirty to seriously consider an open house? Maybe this is the excuse you've been looking for to clean it up!

A few superintendents schedule spring orientation sessions for regular members or players; particularly after the completion of a major project or renovation. The golfers are given a walking or driving tour of the course with explanations as to what has been done with their money to improve the course . . . and hopefully their game. Such orientation sessions can improve your visibility among the golfers and enhance the chances of getting a realistic maintenance budget approved next year. Don't get discouraged if few people take you up on your orientation tours the first time. Like anything new, it takes time for a new idea or approach to catch on.

The club or course newsletter is a valuable resource in increasing your visibility and image. It is also one of the best tools you have for educating the golfer who plays your course. Don't be afraid of writing, even though you don't consider yourself to be an author. Your purpose in writing is not to win a Pulitzer prize, but to regularly inform people of your golf course maintenance activities and why you are doing them. If you can't think of anything specific to say in a particular issue, write something positive about the important role the golf course plays in our

(Continues on page 23)
"Brown! 6 is brown all over!"

Dr. Bruce Augustine explains tensiometers, resistance- and electronic-type water monitoring systems.

**Using soil water monitoring sensors to control irrigation**

By Ron Morris

The most basic description of the water cycle of a turfgrass environment would list input, storage and output. Input is in the form of precipitation or irrigation. Output occurs as evaporation, transpiration, drainage and runoff. Judicious water management would dictate that, to make the most of input, output be limited to that which the turfgrass plant uses for survival.

Once water enters the soil profile, however, visual assurances of conservation are no longer possible. How do you know when you have wet just the rootzone with an amount of water that makes it available to the plant? Obviously more that that is wasteful. If you’ve got water and money to burn, you might care less, except for the fact that the wetter a soil is, the more prone it is to compaction. In fact, a graph would show an abrupt rise in the curve between moist and field capacity.

What determines moist versus field capacity? The tension with which the water is held by the soil particles does. Storage of water available for plant uptake occurs between the wilting point, a tension where water is bound too tightly to soil particles for the plant to use, and field capacity. This is a most rudimentary explanation, however, if you understand soil moisture holding characteristics, according to Dr. Bruce Augustine, Extension Turf and Water Specialist with the University of Florida, then you will be able to water with some effectiveness.

Why moisture sensing equipment?

“What the moisture controlling equipment attempts to do”, explains Dr. Augustine, “is alleviate the golf superintendent from having to understand a lot of soil physics situations. The equipment will activate the irrigation system when the soil gets dry enough and will prevent it from coming on when the soil is adequately moist.” The following is a description of moisture controlling equipment by Dr. Augustine and his comments about them to Golf Business.

“The standard in the industry is the tensiometer. Basically, it is a ceramic cup connected to a vacuum gauge. This gauge monitors the soil suction and gives a good reading of what the availability or lack of water may be. As the soil dries, it creates more soil suction. A micro-switch can be hooked to a solenoid and the system will go on and off at predetermined points on the gauge. The micro-switches are generally hooked to the 24-volt system of the irrigation system.

“The tensiometer, as a standard to the industry, has been the most successful in monitoring soil moisture levels. There are, however, three drawbacks to overcome. Tensiometers do not work well in coarse sand. The pore size of the ceramic cup must be closely mated to that of the soil. If there is a big difference, the tensiometer will not work as well.

“Another problem is servicing. Tensiometers need to be checked periodically to make sure that there are no air bubbles in the vacuum gauge or pump. This is not a major problem, however, unless you have many of them in a given area.

“When you get into a putting green situation, where the root system may be only two inches deep, you begin to run into problems because the tensiometer itself is almost an inch in diameter. If it is installed too close to the soil surface, there are problems with accuracy.

“The biggest use would be a fairway setting. The important thing to remember during installation, is to get them in the root zone. Irrometer Company, one manufacturer, recom-
