SedgeHammer™ Herbicide replaces Manage® to knock out nutsedge in turfgrass and landscapes.

If you relied on Manage® Herbicide to control nutsedge, now you can count on new SedgeHammer™ from Gowan Company. By replacing Manage®, SedgeHammer™ Herbicide provides the same proven efficacy, formulation and safety you need. SedgeHammer™ effectively controls both yellow and purple nutsedge in cool-and warm-season turfgrasses, including areas around landscapes with established woody ornamentals. For more details, call 1.800.883.1844, or visit www.gowanco.com.

Nail your nutsedge.
One of the maintenance crew's first acts under Woodward was to replace every sprinkler head at Torrey Pines.

Continued from page 30
Henderson, Nev. And Woodward's father, Dymond, spent a lifetime in construction and keeps busy in retirement as a starter and marshal at Hassayampa Country Club in Prescott, Ariz.

The family tree also includes Woodward's cousin, Mike Pock, the superintendent at Whisper Rock Golf Course in Scottsdale, and Mike's sons, Ernie and Jay Pock, the superintendents at Grayhawk Golf Club and Whisper Rock's upper course, respectively.

"Mark's a very good individual, and a lot of people look up to Mark in the industry," Ernie Pock says of his second-cousin. "With him having been the national president of our association, he's a lot better in politics than me, my brother or our father will ever be, and I think he takes lot of that from my great-granddad, his grandfather. He's a very good people person, one of the few true politicians in our business."

With most of his time spent inside his Torrey Pines office, Woodward relishes having to supervise three facilities and 95 city employees. He doesn't miss getting his hands dirty, although he regrets that he's often too busy to play — an ever-present urge with the club's North and South courses just a few feet away.

"I look out there every day and see that beautiful facility, with the ocean right there, and it's hard not to get out there," Woodward says. "But my job requires that I spend a lot of time administratively in keeping the operation going."

Despite being one of America's top municipal courses and the annual host of the Buick Invitational — and despite a $3 million Rees Jones redesign of the South Course in 2003 — Torrey Pines, Oppenheim says, had room for improvement when Woodward arrived. And with the U.S. Open coming to the South Course, city officials let it be known that they weren't content.

"This job is way more detailed and there's way more at stake because of the pressure of the Open and the Buick Invitational and those type of things," Woodward says. "But I didn't want to take the easy way out. I like that excitement."

Woodward says he is focusing about 90 percent of his time and effort toward perfecting the South Course. "We're raising the bar on the entire operation, from customer service to the pro shop."

On the agronomy side, he and his crew are into the third round of extensive quarterly aerification and topdressing programs on the greens and fairways. They're also on their way...
to heeding the United States Golf Association's wish that the greens consist solely of Poa annua — currently they're a combination of Penncross and Poa — and that the fairways feature as much kikuyugrass as possible.

All sprinkler heads have been replaced. A comprehensive tree management program on both courses has started. And upon conclusion of the Buick Invitational in February, several tee areas will be rebuilt or expanded, a bunker on the No. 6 fairway will be constructed, and the landing area on No. 18 will be leveled.

“Our course conditions at Torrey Pines are better than they've been in many years,” Oppenheim says. “We've gotten three awards in the last few months at Torrey, and I'm sure that wouldn't be the case if we weren't showing that kind of progress on the course and giving people a great experience while they're out there.”

On top of the physical changes to Torrey Pines, Woodward transferred Balboa Park superintendent Candice Combs to Torrey Pines to evaluate her performance over a three-month trial that was slated to end in late September. Torrey Pines superintendent Jerry Dearie switched to Balboa Park.

“Mark's smart enough from a management standpoint to surround himself with good people,” Holmwood says. “If he misses a beat from a technology standpoint, he makes sure he has people surrounding him that are top quality people. Again, one of his strongest assets is that he's a team player. And he knows how to build a good team.”

On the business side, Woodward is orchestrating a five-year operational plan and a subset of that plan, a 14-year cash-flow analysis of the city's three facilities. The latter initiative was warranted by the impending construction of a 27,000-square-foot clubhouse at Torrey Pines. With the $13 million building slated to open in late 2007, the city wants to determine how course revenues can offset the debt.

“San Diego is going through some budget work, but luckily the golf enterprise fund is in pretty good shape right now, and we're not being hit as hard as some of the other entities are in the city, like the parks department,” Woodward says. “We've got a lot of things going on right now, and they understand we have a pretty big event coming up here in 2008. They're not going to do too much to jeopardize what's going on with that.”

Likewise, Woodward is doing nothing to jeopardize his family life and health. His bride, Amy, finally joined him at their Carmel Valley home in late May. Just days earlier his first grandchild, Trenton Jay, was born in Mesa. Since then, Woodward, an admitted workaholic, has tried to maintain a normal workday — 7 a.m. to 5 p.m., he says — although there's no absolutes with government work.

“We had a council meeting till 10 o'clock on Amy's first day here,” Woodward says. “I'm dedicated to my job and I'll do everything to get it done, but there's life beyond work.”

That might even mean time for a ballgame or movie. Just don't expect buttered popcorn on the menu.

“The doctor says there's a 99 percent chance the diverticulitis won't come back, but I'm shying away from all that stuff,” Woodward says. “I even worry about the sesame seeds on hamburger buns.”
Challenges abound for two superintendents whose golf courses are located on environmentally sensitive federal parkland.
pesticides but with plenty of ingenuity.

The health of the turf, including what he calls a mutant strain of bermudagrass on some tees, and the lack of weeds are a testament to the success of his program as it is to his patience.

"It's all done culturally," says Porter, who graduated in 1977 from Fresno State University with a degree in plant science and soil fertility.

For instance, Porter is not allowed to trap varmints that might tear up turf, but that does not stop him from pursuing them — indirectly. "We're very friendly to birds of prey that go after gophers," he says, noting that hawks are his pals.

Porter removes cutworms from greens by flooding the putting surfaces, which drives the pests to the surface where they turn into meals for the abundant bird population found inside the park.

"Or you can step on them," he adds.

He notes the effluent is not all bad and in fact helps combat clover. The practice putting green located across the street from the course and just outside the door of the pro shop is rife with clover, Porter says, because it is irrigated with potable water.

The guidelines are not just about chemicals. Nearly every spring the annual snowmelt causes a spring to pop up near the ninth green, sending a stream of water over the putting surface and making it impossible to mow, never mind putt on. Nearly half the putting surface is out of play for a good portion of the season.

Porter is forbidden by regulations from installing any permanent drainage anywhere on the course. The best he can do is carve temporary shallow trenches to move the water away from in-play areas and off the course.

Even restoring the land can be challenging. A few years ago, on the recommendation of the United States Golf Association, Porter wanted to remove a fairway bunker located near a small stream. By converting the area to rough, players would avoid having to hit long
As the superintendent of a course located inside Yosemite National Park, Kim Porter hasn't used pesticides since 1981.

"We had to get triple-X clearance" to remove a fairway bunker.

sand shots over a hazard. It was months before he received permission to fill in the small area. Porter first applied to make the change to the parks office in San Francisco. The request was then kicked up the ladder to the Denver office where the decision was eventually made.

“We had to get triple-X clearance to get that done,” Porter says.

Because the golf course land is considered to be a pristine archeological site with possible Native American artifacts buried beneath the turf, any digging or filling-in is tightly monitored. Even the removal of trees more than 6 inches in diameter — ponderosa pine, oak, fir and cedar — must be classified as a danger to be taken down. Otherwise they stay, even if the shade or root structure seriously harms turf growth. Porter says he counts on heavy winter snow to do some of the pruning for him.

Out on Cape Cod in the town of Truro where the Pilgrims first landed before moving on to Plymouth, Eyman has his own hoops to leap through. Highland is a nine-hole layout thought to have opened in 1892, making it one of the oldest golf courses in the country. Originally part of the Highland Resort, the eighth green is located just a few yards from the resort’s Highland House, which now houses the Truro Historical Society.

Behind the seventh green is Cape Cod Light. The original was built in 1792 and sat some 450 feet closer to the ocean, but the lighthouse was relocated closer to the course in 1996, away from the eroding bluffs. The National Seashore, part of the U.S. Parks Department, came to be in 1962 at the urging of President John F. Kennedy. Since 2001, Cape Cod native Eyman has been the superintendent working for the town of Truro, which is the concessionaire and leases the course from the federal government, but plays by federal rules.

Part of Eyman’s job is to submit a list of pesticides and fertilizers he wishes to use on the course annually.

Finally... A Simple Filter Solution for Large Ornamental & Retention Ponds

Tap Into Constructed Wetland Filtration Using Aquascape Designs Patented Snorkel™ Vault and Centipede™ Module System

- One of the most effective BMP's for filtering large bodies of water
- Modular by design allowing builder the flexibility to expand the system to meet project requirements
- Ideal for retention pond construction and restoration
- Reduces the need for expensive and environmentally unfriendly algaecides
- Strips out suspended solids and improves water clarity
- Snorkel clean-out vault allows for easy sediment removal reducing the need for costly and invasive dredging

FREE Pond Product Specifications CAD Drawings CD Rom
- Contains detailed water feature design CAD files that can be "plugged" right into your plans
- Drawings are in several formats for easy integration into your design process with any level of software
- Shows Aquascape Designs professional water feature products installed in appropriate applications including installation notes and details

► In his Designs on Golf column on page 26, Geoff Shackelford advises the golf world to embrace nature.

Continued from page 36

“Even if it’s approved one year, there’s no guarantee it will be the next,” he says. “I don’t know why. They never tell me.”

In 2004 Eyman was allowed to use a popular insecticide to combat grubs. He applied for use again this year and by June, when the window for ridding the course of grubs was closed, he still had not heard.

“You do what you can with what you have,” he says.

In another instance that left Eyman baffled, he was allowed to use a name-brand fungicide. But when the product went to generic labels, he was not given clearance to use those products but could continue to use the name brand.

Although frustrated by the process, Eyman understands the motive.

“I realize the park has its job to do, which is protecting its assets,” says Eyman, a graduate of the University of Massachusetts-Amherst. “So I may not agree with its decisions concerning what I can and cannot use, but I will always abide by those decisions and do the best job I know how to do.”

Part of Eyman’s cultural practice in holding off disease is keeping his heights of cut slightly higher than most courses. His course’s greens are mowed at eleven-sixty-fourths of an inch, fairways at seven-eighths of an inch and the rough at 3 inches. Only tees and greens are irrigated, and irrigation is kept to a minimum over the links-like design.

At Wawona, Porter does the same. Greens are mowed at slightly more than a half-inch during hot months and slightly under in cooler periods. Fairways and tees are mowed at just under nine-sixteenths of an inch.

Incidentally, Porter deals with other problems that few other superintendents face, and these have nothing to do with government regulation.

There is an abundance of mule deer on the property and they have a tendency to gouge the greens with their hooves. Mountain lions and coyotes are the best defense against that problem.

For some reason, bears have taken a liking to one particular putting surface.

“They like to use No. 6 green as a toilet,” Porter says. “Whoever mows that green in the morning takes a shovel with him.”

One of the course’s workers says coyotes have their favorite spots as well. Valve boxes are often their rest stop of choice — without approval of the parks department.

A Rolling Stone Gathers No Moss, Neither Should Your Greens.

Cure and prevent putting green moss infestations with Junction* Fungicide/Bactericide.

Changes in turf maintenance practices have made moss encroachment one of the major problems that golf course superintendents face today.

Left unchecked, moss can out-compete desired turf species and literally choke the life out of your greens. But, there is a proven and simple answer to this prolific problem.

Research has shown that Junction Fungicide/Bactericide, used in a control program, can both cure and prevent moss infestations. And, while dealing with moss, Junction also provides cost-effective control of a wide spectrum of fungal and bacterial diseases.

So, don’t let moss suffocate your greens. Take back control of your greens with the Junction Moss Management Program. For more information about Junction call 1-800-419-7779 or visit our web site at www.sepro.com.
The picturesque Sand Ridge Golf Club was built and is maintained to function in harmony with the environment.
