Planting
Trees and Shrubs

By RONALD C. SMITH and DALE E. HERMAN
North Dakota State University

Trees and shrubs are available in sizes varying from seedlings to large trees. The size of a tree or shrub at planting time often affects its ability to establish. For practical and economic reasons, consider buying medium sizes of trees and shrubs since they usually recover more readily from transplanting shock and establish faster than larger plants. A general rule of thumb is that for each inch in diameter of trunk size, a year is required to adjust for transplant shock or root loss.

Bare-Root Trees and Shrubs

Bare-root trees and shrubs are the most economical type to buy but the most difficult to store and establish. With bare-root stock, care is necessary to protect plants until they are planted. Examine the condition of your stock upon arrival. Keep moist packing material around the roots and store plants in a cool place out of the sun and wind. Plant as soon as possible. Plant bare-root nursery stock in early spring before growth starts. The later bare-root stock is planted, the greater the danger of reduced survival and vigor.

Balled and Burlapped Stock

Balled and burlapped stock is plant material that has been grown in a container for less than one growing season. Local nurseriesmen obtain bare-root stock and pot prior to spring sale. Such stock can be planted throughout the growing season. Remove containers and take care to maintain the root ball intact at planting time.

Container-Grown Stock

Container-grown stock has been growing in a container for one or more seasons. Consequently, the soil medium in the container is usually bound well by dense roots, making transplanting an easier task. Always remove containers before planting. Caution: roots of vigorous container grown plants may grow around and around the inside of the container. Recent research shows that these “circling” roots may not develop strong new anchor roots, but continue growing in a circle around the soil-root ball and may eventually girdle the plant. We recommend that these roots be spread or cut at planting time to encourage normal root growth.

Instant Trees

“Instant trees” include large-sized stock transplanted by a machine. Large non-evergreen trees are best moved in early spring before growth starts. Hardy species can also be successfully moved in the fall upon leaf-drop. Large evergreens are also best moved in early spring. However, spruce and pine can be successfully moved in late August or September. Caution: Transplanting shock is severe when large trees are moved in active growth.

Planting

Dig each hole about twice the diameter of the container or rootball. Remove clay subsoil from the bottom of the holes and replace with topsoil when planting. This is especially important near foundations where poor soil may have been used for backfill. Water thoroughly after planting to settle the soil. Supply water every 10 days during the establishment period. With larger size stock, attention to watering should extend through the second or additional growing seasons according to the rule of thumb above. Therefore a three-inch diameter tree may need watering for three years.

See Diagrams for Planting On Page 23
HOW TO PLANT BARE-ROOT PLANTS

Before planting soak overnight but not over 24 hours.

Dig a hole wider but at same depth as root length.

Prune damaged or weak roots and branches.

Set on firm mound of good topsoil, spread roots.

Plant at the same depth or slightly above the level grown in the nursery.

Fill with good topsoil.

Support larger trees if necessary for one growing season only.

HOW TO PLANT BALLED AND BURLAPPED PLANTS

Handle balled and burlapped items carefully. Do not drop. Lift or carry by holding the soil ball — not the plant.

Set plant on good topsoil. Establish proper depth.

Cut twine tie from around plant stem.

Partially fill hole and tamp firm.

Add more soil after settling.

Reshape basin.

Do not plant more than 1" deeper than ground level or top of ball.

Loosen and fold back burlap.

Carefully fold back burlap to bottom of hole for total soil contact.

Water regularly.

HOW TO PLANT POTTED STOCK

Always remove pots at planting time regardless of material. Maintain the rootball intact at planting time.

Determine depth slightly lower than planted in pot.

Dig a generous-sized hole.

Slit one side of pot. Leave rest of pot intact.

Hold cut pot together with other hand, lower into hole.

Gently slip pre-cut pot-ring out.

Add more soil — Tamp — Water.

Lay pot on side. Cut or tear bottom out.

Place one hand on open bottom to hold soil.

Fill hole with loose soil.

HOW TO PLANT CONTAINER-GROWN PLANTS

Roots of container grown stock usually bind the soil. However, careful handling at planting time will prevent injury.

Always remove containers before planting. Cut encircling roots when present.

Tapered cans:

Turn upside down. Tap rim sharply on edge of a raised surface.

Dig hole before removing plant from container.

Leaves and roots intact.

Lay plant on side. Cut or straighten circling roots before planting.

Backfill with top soil.

Tamp firm but not hard.

Add more soil after settling.

Reshape basin.

Straight cans:

Cut on opposite sides and fold back metal.

Dig hole before removing plant from container.

Leave rest of roots intact.

Fill basin with water.

Water regularly.
