June 1st, 2013 was an ordinary Saturday. I was getting prepared to host some friends over for a back yard barbecue and show them around our family’s new home. Around 1:00 P.M., I put my 2 year old daughter down for a nap and was feeling kind of fatigued and thought it would be a great time to grab some Z’s. During the evening I began to shiver and shrugged it off as being chilled due to the unseasonably low temperatures. After everyone departed I hurried to get under the covers of my bed and warm my body. As I wrestled with my blankets and tried to warm up I realized I had never felt this cold before and questioned, what was going on in my body? Was this it? Am I taking the big one?
The next morning I woke and could not get out of bed, I had a fever and headache, my body ached and I was shivering. I was in bed for all but about an hour of Sunday. Monday I was disappointed when I woke up again to find my health was no better. I still had a headache, body aches and was still shiver. I was needless to say very concerned with my condition but thought I would give it one more day to see if it would improve.

On Tuesday the sun still came up and I still had the same symptoms. I pulled my clothes on and drove myself to work to get payroll done. The drive that morning took every bit of focus I had and was probably not a great decision. I arrived back home and went back to sleep and woke up when my wife called at 11:00 am saying she was very concerned and she had made a doctor’s appointment for 11:50 am. I painfully took a shower and made it to the clinic.

I explained all my symptoms to the Doctor and told him I thought I either had the influenza, a virus or tick bite. He took my temperature at 102 degrees and ruled out influenza because I did not have a cough or a sore throat. He said if it is a tick bite it could be either Lymes or Ehrlichia. The only way to find out was to draw blood test to see which one it was. The results would take 3-4 days and he explained that if I took amoxicillin it would not cure Ehrlichia but if I took Doxycycline it would cure both Lymes and Ehrlichia. I did not want to risk being sick for 3 or 4 more days so I chose Doxycycline. I was able to take two doses of Doxycycline that day. I woke up at midnight with an excruciating headache so I took two Tylenol and went back to bed. At 2:00 A.M. I woke to find myself completely drenched and my headache was gone. My fever had left and for the first time in 4 days I thought I may beat this disease.

I did not make it in to work that Wednesday but by that night I was able to have dinner with my family and could see improvement. My health gradually improved and by the weekend I started to feel normal again. Over the next week my condition continually improved and I regained all my strength. The Doxycycline made my skin very sensitive to the sun which even though the doctor told me it would, I had to learn the hard way. After a couple painful sunburns I purchased some SPF 50 to protect my skin from the big orange ball in the sky.

The following Monday the Doctor called with the results which were that the tests came back negative for
Lymes and positive for Ehrlichia. I had never heard of Ehrlichia before and I hope to never have it again but here are a few specifics that I learned. It is transmitted by a bite of an infected black legged or deer tick and symptoms typically begin one to three weeks after exposure. Symptoms include fever, muscle pain, severe headache, fatigue and chills. Less frequent symptoms include nausea, vomiting, acute weight loss, diarrhea, joint pain, mental confusion, cough, rigors, and skin rash. A tick bite may leave a bull’s-eye or mark only 50% of the time and can be diagnosed by certain blood tests. Both Ehrlichia and Lymes can cause long term side effects if left untreated. These side effects may not show up for months or even years.

I didn’t notice any bite marks or find the tick that bit me but one observation that I did find interesting was that I had a sore back for a month prior to any symptoms showing up. After taking the antibiotic my back pain went away and I haven’t felt this good in a long time.

If anyone isn’t feeling themselves I would recommend going to the doctor and getting checked out. The possibility of having long term side effects was enough to scare me.
**CDC: Lyme disease rates 10 times higher than previously reported**

*Atlanta.* Preliminary estimates released by the Centers for Disease Control and Prevention indicate that the number of Americans diagnosed with Lyme disease each year is around 300,000. The preliminary estimates were presented Sunday night in Boston at the 2013 International Conference on Lyme Borreliosis and Other Tick-Borne Diseases.

This early estimate is based on findings from three ongoing CDC studies that use different methods, but all aim to define the approximate number of people diagnosed with Lyme disease each year. The first project analyzes medical claims information for approximately 22 million insured people annually for six years, the second project is based on a survey of clinical laboratories and the third project analyzes self-reported Lyme disease cases from a survey of the general public.

Each year, more than 30,000 cases of Lyme disease are reported to CDC, making it the most commonly reported tick-borne illness in the United States. The new estimate suggests that the total number of people diagnosed with Lyme disease is roughly 10 times higher than the yearly reported number. This new estimate supports studies published in the 1990s indicating that the true number of cases is between 3- and 12-fold higher than the number of reported cases.

“We know that routine surveillance only gives us part of the picture, and that the true number of illnesses is much greater,” said Paul Mead, M.D., M.P.H, chief of epidemiology and surveillance for CDC’s Lyme disease program. “This new preliminary estimate confirms that Lyme disease is a tremendous public health problem in the United States, and clearly highlights the urgent need for prevention.”

CDC continues to analyze the data in the three studies to refine the estimates and better understand the overall burden of Lyme disease in the United States and will publish finalized estimates when the studies are complete. Efforts are also underway at CDC and by other researchers to identify novel methods to kill ticks and prevent illness in people.
Minnesota Tick-borne Disease Risk*

*Based on average incidence (cases/100,000 population) of Lyme disease and human anaplasmosis cases in Minnesota, 2007-2011

Tick-borne disease (TBD) risk is confined to forested areas throughout the state.

Take precautions to prevent TBD when visiting these areas.
How Not To Remove Ticks

Don’t RemoveTicks With Your Fingers.
In many cases a tick is likely to be carrying pathogens such as lyme disease, ehrlichiosis and others that are harmful to humans and pets. Tick saliva or blood is something you don’t want on your skin. Pulling on a tick, even with tweezers, can tear the mouth parts from the body of the tick and leave embedded parts in the host.

Don’t Squeeze, Crush or Squash A Tick.
This can force spirochete and other infective body fluids through the mouth parts of the tick into the host. Don’t Apply Substances To A Tick. Applying any substances, such as petroleum jelly, fingernail polish remover, repellents, or a lighted match that upset or harm the tick almost always cause the tick to vomit the contents of its stomach back into the host. No matter how badly a tick may want to remove itself, it is not capable of doing so quickly. Ticks can live without air for long periods; attempts to smother it can allow disease transmission for hours.

You may or may not have the typical “bull’s eye” rash often associated with lyme disease.
