AN UPDATE ON SANDS FOR TOPDRESSING GOLF GREENS

by DON TAYLOR
Assistant Professor, Social Science
University of Minnesota

Two years ago we published in the HOLE NOTES a chart listing the particle sizes of some sands available in Minnesota. Since that time some new sands have become available and some questions about the other sands have been raised. Consequently, I collected new samples from several companies this summer and determined the particle size and pH of the sands. I also check for carbonates by applying some hydrochloric acid. The presence of carbonates is the main reason some of the sands are in the alkaline pH range. The results of the measurements are shown in Table 1 on Page 13.

Even with these figures, choosing the best topdressing sand is not easy. Opinions of superintendents, as well as researchers, vary widely. For whatever it's worth, I will give my opinion on what to look for in a topdressing sand or mixture.

1) Particles with diameters greater than 1.0 mm are too large. These are the ones that are most likely to interfere with putting and be picked up in the mower. I would keep the percentage of these particles as low as possible.

2) Particles between 0.25 and 0.50 mm are the best. I would make sure the sand I used had a high percentage of these particles.

3) I think sand with a small amount of soil (80-80% sand and 10-20% soil) is preferable to either straight sand or sand-peat mixtures. For the soil, I would use a topsoil with a high clay content and as low a silt content as I could find. In research done by Cooper and Skogley in Rhode Island (Putting Greens Responses to Sand and Sand/Soil Topdressing, USGA Green Section Record, May/June 1981, pages 8-13), sand-soil mixture topdressing led to better fall color, earlier spring green-up, and better overall quality than topdressing with straight sand.
TURFACE
Soil Amendment
GIVES SUPERB DRAINAGE
AND AERATION

Apply at time of aeration by removing plugs and topdressing with Turface. Lets roots breathe! Turface acts as a "Separator" in sticky, gummy soils.

Quality aerators for large areas.

Renovaire
Large area, contour turf aerator

The Renovaire is ideal for aerating large turf areas. It’s fast... at speeds up to 10 mph, it aerates a 6-ft.-wide swath. It’s effective... with its special design, it aerates rolling turf as easily as level areas. The 12 tine wheels operate in pairs to follow the lay of the land. Coring, slicing, and open spoon tines are available for use all season. It can be equipped with a large 12-ft.-wide dragmat to break up cores and groom the grass in one operation.

...AND Gould's IS YOUR AREA'S AUTHORIZED RYAN DISTRIBUTOR!
