The Next Generation Cushman® Turf-Truckster®

In 1964, we created the world's first Cushman Turf-Truckster...and a whole new class of vehicles. Imitators soon followed. But none with the same soul. The new Cushman Turf-Truckster features a truckload of improvements including the only fully automatic transmission in a heavy duty work vehicle. With the same rugged dependability as the original, the Turf-Truckster remains, as it began, in a class by itself. Call 612-333-3487 and drive the new Turf-Truckster today!
FROM YOUR PRESIDENT'S DESK

Jim Nicol Encouraged To Run Again For GCSAA Board

This year was the first time in over 20 years that we had a candidate from Minnesota run for the Board of Directors of the GCSAA. I was very pleased that one of our members was willing to dedicate his time and effort to represent our Association and Superintendents in general at the national level. Jim Nicol conducted a great campaign, raising good issues and working diligently through Friday night and into Saturday morning. Unfortunately, there were six other candidates running for three offices — two candidates being incumbents. This made it even more difficult to win a seat on the Board. Despite the hard work by Jim Nicol and Jerry Murphy, and 42 out of 87 Chapters supporting Jim, he came within 700 votes of winning the election.

On behalf of our Association, I would like to thank Jim for his efforts in running for this national office and encourage him to consider running again.

* * * *

I would like to thank Steve Young and Dan Miller for arranging the hospitality room at the National Conference. We had a great turnout of 150 plus people who enjoyed the food and fellowship until the hotel closed the room. Steve said he is working on next year’s party in New Orleans. We hope all of you will continue to attend. * * * *

Each year as we attend the National Conference we wonder about what new technologies are in store for us. I am amazed at how many new products come on the market every year. This year I learned three methods to prevent bunker banks from eroding, saving golf courses considerable time and money by not having to push sand every time it rains. The Conference is a great education tool to learn more efficient methods in maintaining golf courses.

* * * *

Mike Klatte and his committee have begun planning this year’s MTGF Conference. They have made some interesting changes for this December. If anyone knows of a good speaker for the program, please contact Mike. He is always open to new ideas.

Tie a Yellow Ribbon 'Round That Old, Old Pond

By MICHAEL BROWER
Hillcrest Country Club

Every time I step on a golf course, I see acres and acres of well-kept, fine turfgrass. I'm truly impressed with a Golf Course Superintendent's ability to meet the demands of today's golfers. I have a passion for lovely, smooth and fast greens. Lately though, I have taken a closer look at another type of grass on the golf course, ornamental grass. I now have a passion for lovely, colored and hardy ornamental grasses.

Ornamental grasses have been around a long time, but until recent years, they really weren't used extensively in the landscape. I'm beginning to see a change though, especially on golf courses. I recently took a long look at a nice looking pond on our golf course and said to myself, "I'm going to tie a yellow ribbon around that old, old pond!" My inspiration came from the awesome displays of ornamental grasses that I had more frequently been seeing along roadides, on private property and on Southern golf courses of America.

My search for the right grasses for this project made me aware that my options were abundant. It soon became a choice of what look we wanted, and how much money were we willing to spend on this yellow ribbon. There were no less than six local nurseries with wonderful plant material at reasonable costs. That yellow ribbon was now becoming a mix of colors, but wonderful ones at that. My final choices were Miscanthus sinensis "Silberfeder" Silver Feather, an elegant, upright grass of six feet with shimmering white fan-shaped blooms, Miscanthus sinensis "Purparescens," with growth to four feet, and leaves that turn bright red-orange in the fall and Calamagrostis acutiflora "Karl Foerster," a showy, five foot tall grass with showy, feathery plumes. Buying in bunches always pays off, and we were able to find a very large wholesale nursery here in the Twin Cities that was selling quart pots of established plants for $2.30 per plant. If you're looking for results the first year, and a better chance of survival, buying rooted, potted plants is preferred over bare root divisions for ornamental grasses. After measuring the length of the pond perimeter, and deciding on how deep our ribbon would be, we placed our order for plant material and supplies. A good rule of thumb is to space plants equal to their mature height, but this depends on the look you want to achieve. We decided to plant with four foot spacing. Another good rule of thumb, which also depends on what you want to achieve, is a minimum of eight feet for your buffer or ribbon of plants around the pond.

These rules of thumb will help you accomplish several important things: it gives you some insurance in case you lose a couple of plants here and there and it will generally be thick enough to allow nesting of ducks, songbirds, butterflies and other small wildlife. It will act as a barrier to the pond for geese and it will give you more flexibility and creative freedom to vary your plant groupings and textures.

There are several ways to go about preparing the site for planting. I prefer not to use herbicide to get rid of existing plants or grass along water. My choice is to pull or dig any undesirable plants and use a sod-cutter to remove sod and other matted plant material. In this ribbon project, I also chose to seed the entire buffer with a mix of perennial and annual wildflowers and sheep fescue. Preparation of the soil for seeding is easily accomplished with the use of a small garden tiller or can be hard-raked by hand. A couple of (Continued on Page 7)
EAGLE™ Series Rotors

Call your Rain Bird Golf Distributor at 800-422-1487
Inches of loose soil will provide good seed to soil contact necessary for germination. Dispersal of the seed is best done with a small hand-held spreader. I highly recommend the use of wildflower seed along with the ornamental grasses in these situations. The wildflowers will provide good color the first year and beyond, while the ornamental grasses become more established. Sheep fescue will provide a nice nurse crop for erosion control and aesthetic purposes while the wildflowers mature. Seeding rates for wildflower seeds are typically 6-12 pounds per acre, there are usually about 500,000 seeds per pound, and prices range from $20-40 per pound, so you undoubtedly get a lot of bang for your buck (and a lot of color for your ribbon). I always use the higher rate with wildflower seed. The use of an erosion control product can be beneficial, but many of the rolled matted versions do not allow a large amount of the wildflower seedlings to poke through the material and become established. I prefer the bagged, recycled paper products that can be easily spread with a small walk-behind spreader, which spread out and hold water once they are wetted down on the surface. A new variety called Penn Mulch comes with a small amount of starter fertilizer which is helpful for plant establishment, and has performed very well in these ribbon projects for me. Once you have done the measuring, figuring, searching and purchasing of materials, this is a good ribbon recipe:

1) Pull out or dig up any undesirable broadleaf plants.
2) Remove grass and other matted vegetation with sod cutter.
3) Till or hard-rake to a minimum depth of two inches and smooth.
4) Spread wildflower and sheep fescue seed over site and rake in.
5) Spread erosion control and plant aid mulch.
6) Plant ornamental grasses at desired spacing.
7) Lightly and frequently water daily until established. If your site affords you the opportunity to plant small colonies of woody plant material (both deciduous and evergreen) on the boundaries of the ribbon, you should use that opportunity. This will add even more textures for all four seasons and will dramatically advance your efforts to increase the songbird population. Plant shrubs and small trees that will benefit wildlife like crabapples, hawthorns, dogwoods, birch, serviceberry, winterberry, plum, cherry, mountain ash, lilac, arborvitae, yew and viburnum to name a few. You will notice the increase in songbirds and other desirable creatures soon after planting and will be just as pleased when you begin to hear the positive comments from the golfers about the beautiful ribbon of color and unusual texture that you’ve added to the course.

These projects are best done in the spring, which will allow for a full year of development of the ornamental grasses before winter. Once established, very little maintenance is needed for all of these plants. In early spring each year before new growth begins, the wildflowers and ornamental grasses must be cut back to the ground or burned if permitted and supervised closely. If this isn’t done, growth will be delayed and full potential not reached. String trimmers work fairly well, but burning is recommended at least every other year. Injury to the plants and the loss of winter ornamental value will result if cutting or burning is done in the fall. If you would like to find out more about ornamental grasses for this region, contact the University of Minnesota Extension Service to order the North Central Regional Extension Publication #573, titled *Ornamental Grasses for Cold Climates*, written by Mary Hockenberry Meyer, Don White and H. Pellett, all professors in the Department of Horticultural Science at the University of Minnesota. This is a wonderful reference for species names, growth characteristics, ornamental value and hardiness.

Ornamental grasses offer a change of pace from the well-manicured turfgrass on golf courses. They’re fast-growing plants, ornamentally attractive throughout the year, require little maintenance, have very few pest problems and add a terrific variety of texture and color to the golf course landscape. Go for it! Tie a yellow ribbon around that old, old pond!

The 1999 golf season is getting closer. Now is the time to reserve your custom Hydroject 3000, Liquid Wetting Agent and/or Soil Reliever Deep Tine Aerification applications for the summer.

THE HYDROJECT 3000

The Hydroject 3000 water injection aerator is one of the essential tools golf superintendents have in helping to maintain healthy turf throughout the growing season. High velocity water injection penetrates 4 to 8 inches and laterally fractures soil layers. This type of penetration improves water uptake and advances root growth that gives you a more stress tolerant turf. With the Hydroject 3000 we can aerate your greens or other turf areas when they need it most; just days before a tournament or under a hot stressful sun. Hydroject 3000 smoothes greens as well. You will have a more uniform putting surface while keeping the same height of cut; you can even increase green speeds 10 to 15 per cent.

A NEW OFFER - LIQUID WETTING AGENT

Wetting agents have been used to maintain healthy turf by improving the efficiency of water use along with other products you apply during the growing season. In the past, wetting agents ran through the hydroject in the form of a dissolvable tablet. Now it can be applied at varying strengths in a liquid form so we can apply the amount you desire. We can use your wetting agent or we will supply the wetting agent.

SOIL RELIEVER DEEP TINE AERIFICATION SERVICE

The combination of greater water usage, heavier equipment and increased foot traffic results in deeper compacted soils. When poor drainage symptoms occur due to compaction, cultivation practices should be increased. Plants require oxygen to grow. By relieving compaction with the Soil Reliever, you will have a root system down to the depth you aerify. With deeper roots you get more wear tolerance with less stress, therefore a healthier turf grass. Our Soil Reliever can use a solid or coring tine at depths for 8” to 12” and diameters of tines from ½” to 1 inch. The hole spacing can be from 3” to 5”. We provide 1 set of tines, the tractor, the Soil Reliever and the operator, or we can deliver it without the operator and provide instructions on how to operate the Soil Reliever so you can rent it over a period of days. The prices vary with or without an operator and will be determined by the square footage of the area contracted.

Please contact Jerry Webb at Prestwick GC for prices and scheduling on the dates you desire.

651-459-0288 or FAX 651-458-9175
olf course superintendents like yourself are making plans to get their courses in top shape for the new season. And irrigation is at the top of their lists. Century golf professionals can show you how to maintain a highly-playable course, and can help solve any irrigation or drainage problems. They can also show you what’s new in clubhouse landscape lighting, water features and more. Call today for a FREE catalog and on-site consultation: 800-347-4272.

**Controller Board Repairs**

Call Century when you need controller board repairs for Rain Bird and Toro golf controllers. Replacement boards can be shipped within 24 hours. Call 888-855-9132.

**SyncroFlo Pumps**

An efficient pump station can solve many irrigation problems. Century now offers the SyncroFlo Eagle Series, the premier system for golf courses.

**Aqua Master Fountains**

Improve water quality with an aerating fountain. Century can also show you how to create water features from existing streams or ponds.
