The State of Maryland offers a good example of the need of soil tests. Maryland is divided into 3 major physiographic regions—the Coastal Plain (eastern shore and southern Maryland), the Piedmont (central Maryland), and the Mountain Region. Soils of these regions were developed from different parent materials characteristic of each area; thus, some soils are vastly different from others.

A further breakdown reveals that there are approximately 280 different soil series in Maryland and each soil series has a different capacity for supplying food. If we consider variations in surface texture, we must contend with about 700 different soil types. If we then consider variations in previous practices such as fertilization, cultivation and drainage, the soils in Maryland have literally thousands of different combinations of fertility and soil capability levels.

Because of these variable soil characteristics, the best way to predict the amounts of lime and fertilizer needed to balance the natural soil fertility and to satisfy plant needs is by having your soil tested. The University of Maryland Soil Testing Laboratory provides this service free for Maryland residents.

In some cases, soil fertility problems are unusual or more complex than normal. To help diagnose these problems, the University of Maryland Soil Testing Laboratory also runs special tests on soil samples. However, for most crop and soil conditions, it is not necessary to have these special tests run on your soil. If you have a specific problem with your crop, contact your county Extension agent to determine if the special tests may be helpful in diagnosing the problem.

WHEN SHOULD SOIL SAMPLES BE TAKEN?

Soil samples can be taken anytime during the year when the soil is in a satisfactory condition for sampling, that is, not too wet, frozen, etc. Soil samples taken when the soil is too wet should be air dried before sending to the soil testing laboratory.

SUBMITTING THE SOIL SAMPLE FOR TESTING

Be sure that the sample was carefully taken so that it is representative of the soil in the lawn, garden, or field. Complete the information sheet and submit it with the sample. The sample can then be delivered to your county Extension office or delivered directly to, or mailed to the Soil Testing Laboratory, University of Maryland, College Park, Maryland.

The soil sample is often the weakest link in the soil testing program. To strengthen this link, and to assure that the soil test results will be as accurate and as meaningful as possible, you must see that the soil sample is taken carefully and conscientiously. The testing procedures used by the Soil Testing Laboratory are precise, and can be used to determine the fertility status of the soil in the sample. But to be useful, the soil in the sample must be representative of the soil in the area sampled.

Remember! Soil test results can be no better than the soil sample you submit.

NEW GCSAA OFFICERS AND DIRECTORS

President Charles G. Baskin, Connecticut
Vice President Palmer Maples, Jr., Georgia
Directors Theodore W. Woehrle, Michigan

Charles Tadge, Ohio

CHANTILLY NATIONAL GOLF AND COUNTRY CLUB

Our March dinner at Virgil Robinson’s Chantilly C.C., which came in a succession of surprise platters, was undoubtedly one of the best dinners our association has had the pleasure to enjoy. Our thanks go to Virgil for his work and efforts which made for a very successful first meeting of 1974.
