SATISFACTORY drainage has much to do with the perfection of an attractive golf course. The importance of adequate drainage to any golf club, which desires a well-kept course and contented members, cannot be overestimated. The wrath of golfers, who are kept off “their” course until the ground has dried after every rain storm usually is quite forceful. Their opinions of the club management, Green chairman and greenkeeper generally are expressed in very plain language.

Standing water and miniature ponds, where the design of the course calls for dry surfaces, are most uninviting. Not only is the dampness unpleasant but the accompanying mud is still worse. Under such conditions it is necessary for the course to be closed to play and for the aggravated golfers to await the pleasure of Old Sol.

While some sections of this country are blessed—or cursed—with rainy seasons during which rain may be anticipated and prepared for, other portions of the country are likely to be visited with rain almost any time. The severity of the downpour, also, is uncontrollable. The “weather man” has an annoying habit of ignoring tournament plans. Often a sudden shower will either postpone a match
Outstanding Features of Interest To the Progressive Greenkeeper

To maintain perfect greens as demanded by present-day golfers, perfect cutting of the grass, frequent rolling of the turf, aerating of the soil, brushing in top dressing and brushing off worn casts and other refuse, are necessary operations which require considerable care if the surface of the green is not to be injured. The ever-increasing popularity of the Cooper Putting Green Mower is due to the fact that it eliminates manual labor from greenkeeping and under its own power performs these various operations efficiently and quickly.

The high-speed, seven-blade reel trims the turf to perfection; the smooth sectional aluminum roller with differential action for easy turning, supplies traction and provides with each cutting that gentle rolling action that levels without packing; finger tip control and independent operation of blade reel and traction roller make the mower extremely easy to handle. The light but strong steel and aluminum alloy construction, Briggs & Stratton motor and grease packed gears with ball and roller bearings throughout are Cooper features that insure longer life and trouble free service.

Of particular importance is the fact that this mower has the famous quick-detachable “drop-out” reel and bed plate unit pioneered by Cooper. Both reel and reel are chain driven and the latter can be operated in reverse for self-sharpening. Additional investment in a transport cart for this mower is unnecessary.

Storm Water Drowns Bacteria

Soil may be ever so fertile but, if it is not properly drained, it is unsuitable for the growth of turf. Storm water not only drowns the necessary soil bacteria but affects the porosity or ventilation of the ground. Mineral salts and fertilizer elements are dissolved in stagnant water and are washed away. Such soil changes are highly undesirable for turf growth.

The importance of adequate drainage in satisfactory golf course maintenance is being recognized more and more. There is scarcely a country club which, either willingly or unwillingly, is not obliged to give the subject consideration. Plans for new courses should always include provisions for drainage.

Drainage has a direct effect upon maintenance expenses. Reseeds, refertilizations and other expensive items of cost in many cases may be traced to poor drainage. This relationship is so close that it cannot be ignored. An adequate drainage system is an investment
which will pay dividends in reduced cost of maintenance and in general satisfaction.

Like other investments of magnitude, the installation of a drainage system on a golf course requires the most careful consideration. As each piece of property has its own individual topography and soil characteristics, each site must be studied separately. The best advice can only be given by an engineer well qualified by experience in the particular field of golf course drainage and soil physics.

Drainage has many technical aspects beyond merely providing for the elimination of surplus surface water. If it were merely a problem of laying necessary drainage lines to drain off accumulated water, the laying out of a drainage system would not be so complicated. There are many other things to be considered, none of which should be neglected.

**Two Phases of Drainage**

There are two distinct phases of drainage—surface and underground. Both are equally important. Underground drainage cannot be observed but its effects are soon apparent.

Soil varies greatly in texture and composition. Some types of soil, such as sand, permit free seepage of water without hinderance; other types, like clay, do not permit ready drainage. A knowledge of soil physics can only be obtained from observation. Naturally, such knowledge is possessed by very few.

The flow of water underground depends upon the texture of the soil and other important factors. This direction of underground flow may be vertical, horizontal or obliquely downward. At the surface, capillary action of the soil even draws underground water upwards. The direction and rate of flow of the downward drainage requires the most careful study in order to ascertain the underground lines at which water is likely to accumulate. When these lines have been located, it is comparatively easy to install tile lines at the proper levels and to arrange for the water’s disposal.

The drainage of surrounding property also must be considered. In some cases, golf courses drain naturally and satisfactorily into lower areas thru the underground stream. However, such instances are somewhat rare. More common are instances where drainage water from

"Beautiful Turf from Tee to Green"

**For Your Fall Work**

—whether in connection with renovating or new construction, late summer or early fall (Aug. 15th to Oct. 1st) is by all odds the best time to sow seed.

Because of the extreme fineness and beauty of turf produced from *Bent Seed*, we recommend the use of a certain percentage of bent in all mixtures for Fairways and Lawns.

**For the Finest Turf, Sow Bent**

**Grass Seed of Known Quality**

**TESTED for PURITY and GERMINATION**

South German Bent Colonial Bent
Rhode Island Bent Creeping Bent Stolons

Wholesale prices on the above, or any other turf grasses, such as Fancy Red Top, Ky. Blue, Chewing’s N. Z. Fescue, etc., on request.

**COCOOS BENT**

Because of the fine turf producing qualities of this Creeping Bent, it is meeting with favor in sections other than the Pacific Coast, where it is already recognized as the outstanding Putting Green Grass.

We offer the true Cocoos Bent, the finest of the Agrostis maritima grasses, in sealed bags.

**Per lb. $2.50, per 10 lbs. $23.50, per 100 lbs. $200.00**

**Special Putting Green Bent Formula**

consists of imported and domestic grass seeds of the highest quality, that will produce a fine, uniform and enduring turf. Further information and prices on request.

**Superfine Fairway Formula (with Bent)**

contains Bent seed, as well as Kentucky Blue Grass, Superfine Red Top and Chewing’s N. Z. Fescue. We adapt it to your conditions so a uniform and enduring turf is secured. Further information and prices on request.

**Special formulas for Tees, Rough, Bunkers, Lawns, etc., on request.**

**Remember:**

We are one of the largest direct contractors for foreign-grown Grass Seeds in the United States. Over thirty years of Seed Service have enabled us to segregate those collectors of Bent Seeds who are reliable from those who are not; to single out those growers of Chewing’s Fescue whose strains are pure; also to contract for true American-grown seeds of high vitality. All our seeds are botanically true to name and are cleaned and re-cleaned until brought up to the highest possible state of purity and germination, special care being given to the elimination of weed seeds.

Without obligation we shall be pleased to send a representative who, from long experience, is qualified to advise regarding grasses and furnish such other information as is necessary for the best results.

**Stump & Walter**

Specialists in Golf Grass Seeds and Equipment

30-32 Barclay Street New York City
Three Years' Guarantee on every Thompson Master Sprinkler!

There is a pride of craftsmanship in the Thompson Manufacturing plant which is reflected by their complete confidence in their products. Thompson Master Sprinklers have the full engineering benefit of a quarter of a century successful sprinkler experience.

Because only the best materials are used, combined with Thompson workmanship, a full three year guarantee is placed upon every Master Sprinkler. Regardless of cause, if any part breaks or proves unsatisfactory in service we will replace it free of charge!

The Thompson Master Sprinkler is designed to save you money. It cuts down your water bill by giving you even coverage on the greens and fairways. Because of its uniform distribution and wide coverage the watering of your grounds requires LESS labor.

The remarkable "one-twist" feature of the Thompson Quick-Coupler and Quick-Coupling Valve used on permanent underground installations for the Master Sprinkler is exclusive in the Thompson System. Let us send you our catalog with complete information about this labor-saving feature.

CHECK these features found only in the Thompson Master Sprinkler!

1. Master Sprinkler gives greater uniform coverage without wasting water.
2. Operates on pressure as low as 20 lb.; with an average of 45 lb. pressure it will cover an entire acre with only 8 moves.
3. Low center of gravity, does not tip over easily.
4. Offers less of a play and wind hazard.
5. Three-year absolute guarantee.
6. Light in weight—9 pounds including roller base—easy to move. Saves money on labor bills.

Locate an Outlet First

One of the first things to be done in laying out a drainage system for a golf course is to locate a drainage outlet. A topographical map of the property is of great assistance. A glance at it will reveal which areas are the lowest, and the most suitable of these can be considered for the drainage outlet. In many cases low areas will be found in the central portion of the property which may be converted into an attractive lake or lagoon. This simplifies the problem but does not solve it. Preparations must be made thru dams or weirs to control the excess water and to pump it to a permanent disposal.

Generally, the natural drainage outlet to a golf course is upon neighboring property. Neighbors have a tendency to be very unneighborly when it comes to drainage. Frequently permission to make arrangements for drainage will be denied even when the adjacent property will be injured in no way. Sometimes the most stubborn mulish obstinacy will be encountered—usually with the expectation of forcing a cash settlement. This is another possibility that should have been considered in selecting the site. Lawsuits to determine drainage rights are long and costly. Before acquiring property for a golf course it should be inspected by a competent drainage engineer.

If arrangements cannot be made to drain the higher levels flows down upon golf course property either above or below the surface. In the former case, surface drainage can be restrained at will but in the latter case the flow of the underground stream cannot be prohibited and there is no remedy, except provisions to take care of it. These considerations should have been given attention in the selection of the site.

The topography of a golf course with its natural or artificial mounds and hollows is certain to call for surface drainage. The slope of fairways, greens, bunkers and traps determines the direction in which they will drain. Unless their centers contain saucer-like depressions, greens usually may be drained without difficulty. However, care must be taken to prevent storm water from running down the sides and accumulating in the traps or pits.
property upon the adjacent land, permission must be secured from the city, county or state officials to lay sewer lines along the highways to a satisfactory point of disposal. In some sections of the country storm water may be dumped into open ditches. However, in many places such ditches must be either covered or protected. In some cases the water must be taken a considerable distance to a river or lake, or some definite outlet.

When the drainage outlet has been determined, plans must be made to direct both the surface and underground water to that point as efficiently and economically as possible. Lines of hard burnt shale tile have been found the most satisfactory.

**Not Necessary to Seal Joints**

In most soils it is not necessary to seal the joints of the pipe as it is desirable that they should be open to admit more water. In some soils, however, it is necessary to seal the joints with Ric-Wil filter tape. Otherwise, the water will draw too great a quantity of sand or fine soil into the tile line. While it is desirable to backfill the drainage trenches with gravel, which will permit the ready seepage of water, this is not practical except occasionally. However, most soils, except clay, may be used for backfilling, provided a layer of cinders or gravel is placed just above the tile line.

The placing and spacing of the tile lines require the most careful forethought. It is the character of the subsoil, rather than that of the surface soil, which determines the rate at which water moves towards and into the tile drains. Tile lines must be placed at right angles to this underground flow and at such depths that the underground water will not only seep into them but will also flow into them horizontally or obliquely. In order to determine the depth and location of these lines the drainage engineer needs a thorough knowledge of the subsoil and all of its characteristics.

The surface water, too, must be directed into the tile lines. This is accomplished thru the construction of catch basins at strategic spots on the course. These catch the surface water and direct it into the tile lines. These inlets average about three feet in diameter. Their depth varies according to the depth of

**Milorganite**

*Milwaukee*  
**MILORGANITE**  
**IDEALTURF FERTILIZER**

Returns Handsome Dividends On New Fairway Seedings

The belief that two to three years are required to produce good fairways is wrong.

It is true that sparse turf once obtained is difficult and expensive to improve, and often deters prospective members from joining new clubs.

Experienced golf course builders know that success depends upon supplying the young expanding seedling with ample nitrogen and phosphorus during the critical first six weeks.

Milorganite has been used prior to seeding with conspicuous success on more outstanding courses than any other fertilizer.

Milorganite is an ideal source of organic nitrogen, more effective than manure and free from objectionable weed seeds. It is easily applied and will not injure the sensitive young seedling.

We are prepared to make soil examinations and specific recommendations.

For further information address

The Sewerage Commission  
Milwaukee, Wisconsin

Milorganite used on Established Fairways this fall will produce better turf next year
And Now for Low Pressure Systems

The Economy Husky—a new sprinkler that throws a full stream of water, breaking it up for proper distribution. Demand has produced this new type and used with the April Shower nozzle, it is already indispensable to hundreds of greenkeepers.

Economy Sprinklers are well known for their sturdiness, long wear and specific application to the various problems of golf course irrigation. The Economy President, best for quick coverage on hoseless systems, the Super Simplex, for quick work on the greens, the Traveler, the Spectacular, the new Quick Coupling Valve—each of these is doing its part to make all water systems adequate.

Write for the name of our agent nearest you. He can demonstrate and give you some worthwhile information.

Distributors in leading American and Canadian cities

The tile line below the surface. In fact, the bottom of the catch basin should be about three feet below the tile line in order to provide a receptacle in which to catch silt, sand or dirt and prevent it from settling into the tile line. These basins should be cleaned out at least every season.

One or More Trunk Lines

The usual drainage system consists of one or more trunk lines, varying in size from eight to twelve inches in diameter, and a number of four-inch or six-inch laterals. The use of smaller tile than four-inch is not practical as the smaller size would obstruct the flow.

Tile lines must be laid with the greatest care. A slope of two inches to a hundred feet is sufficient for the larger sizes while a slope of three inches to a hundred feet is necessary for the smaller sizes. This grade can be increased to bring the end of the system on a level with the drainage outlet. However, if the end of the system falls below the drainage outlet, a pump must be installed. Grades should be taken every hundred feet and every effort should be made to keep the tile lines at the proper levels.

The expense of installing a drainage system is considerable and it is very important that it should function properly. This means that it must have been properly designed and honestly installed. As nearly all of the work is underground, where it cannot be seen, there is a chance for slovenly, negligent work. Before the backfilling is commenced, all tile lines should be carefully and conscientiously inspected by a competent drainage engineer. The work should not be paid for until the club has some assurance that the system will function.

The growing season, which sometimes limits the golf season, is prolonged by adequate drainage. Drained land is from ten to fifteen degrees warmer than undrained land, which makes the drained soil freeze later and thaw earlier. It is only possible, through drainage to keep an abundance of oxygen in the soil, so indispensable to the life of the turf. This element is necessary before the necessary chemical changes can take place in the soil. Naturally,
TOURNAMENT SCHEDULE

JULY
8-11 California Junior Championship, Del Monte, Calif.
10-11 Northern California Women's Golf Association Invitational Tournament, Del Monte, Calif.
10-12 National Open, Interlachen C. C., Minneapolis, Minn.
17-19 Fairview Open Championship, Fairview Country Club, Elmsford, N. Y.
31 Invitation Tournament for Buckwood Trophy, Shawnee C. C., Shawnee-on-Delaware, Pa.

AUGUST
1-3 Midsummer Tournament, Del Monte, Calif.
5-11 National Public Links Championship, Municipal Golf Course, Jacksonville, Fla.

SEPTEMBER
30-October 1 Arcola Senior Championship, Arcola Country Club, Arcola, N. J.

OCTOBER
13-18 Women's National Championship, Los Angeles Country Club, Los Angeles, Calif.

Golf Course Construction from the Greenkeeper's Standpoint

By EDWARD B. DEARIE, Jr.

(Continued from page 16)

these factors have an important bearing upon the condition and appearance of the turf.

Not only is the duration of the playing season extended by satisfactory drainage but the number of play-
able days are increased for golfers are not kept off the course after each rain until the soil has dried but are able to play immediately after each storm.

Next Month: Chapter V—Irrigating the Golf Course.

Erich Pahl is Busy

A busy boy these days is Erich W. Pahl, greenkeeper at the Interlachen Country Club, Minneapolis, where the National Open Championship will be held July 10-12. Erich is a N. A. G. A. member and is noted as one of the best greenkeepers in the United States. It goes without saying that Interlachen will be in splendid shape for the tournament.

The course is long, is scientifically trapped, and its fairways and greens are in beautiful condition. Erich has had the hearty cooperation of his Green committee chairman, Charles Van Nest, who is in general charge of the tournament, and has been Chairman of the Green committee for many years. Grasses, greens and fairways always have been his hobby.

A stroke tougher than Oakmont is Jimmie Johnston's appraisal of Interlachen. And who should know better about his home course than the National Amateur Champion? Johnston led the field two rounds in the open at Oakmont in 1927 and but for a mediocre third round might have won the title. Bobby Jones has found Oakmont his one real Waterloo in open competition in the last ten years.

Jimmy further asserted that Interlachen is not likely to be burned up by any of the boys. The course calls for a wonderful variety of shots and accuracy will be the principal requirement for scoring. Contestants who have mastery over their long irons will have an advantage, for they will be playing to narrow and small greens—and none of them will get more distance than they earn off the tees, or with their second woods. The fairways, always kept in fine condition by the splendid watering system, will not be baked as are so many courses in midsummer. The greens will be fast and difficult because of the trickery of bent grass.
