"Seed Label"). Remember all certified seed that comes out of the production field is tested via random samples. The cleaner selects a pound at random and it is sent to a state laboratory.

Sports Turf Irrigation
Dean Cormack, Service Manager, Vanden Bussche Irrigation & Equipment Limited

Design
Design looks at the greatest amount of irrigation coverage keeping in mind budget restraints. Dean advises going to more than one person with your design and compare. Every design, whether a golf course or a sports field, is site specific. The design is also dependent on where the water is coming from. VBI does not design so that sprinklers are at their maximum. Many companies will do a design at no cost but make sure it meets your specific irrigation needs.

Installation
It is extremely important to use qualified contractors for installation. Landscape Ontario has a good program for training installers. There is no certification required in Ontario to put equipment in the ground although it is required in other parts of the world. You will sleep better at night with a qualified installer. Ask around to check on systems irrigation companies have installed in the past. Whether you are a village, town or region, you need an on-site supervisor who will ensure quality workmanship, no short cuttings and that the specifications are being followed.

Equipment
As a customer, you want after-care support. Have a competent person come out and train you on the system – nine times out of 10 the contractor will say here are the keys to the pumphouse and leave. Make sure the company you select for your equipment has people to train you and your staff to ensure you get the most for your money. There are many cases where the contractor left the keys to the irrigation system and the superintendent did not even know how to turn on the computer, repair a sprinkler, valve or controller! It is up to the distributor who has the responsibility to see that this happens. If you are not getting support, get in touch with the distributor and say I need some training on this system.

Irrigation Goals
As turf managers, you are all working toward the same end – consistency of turf, consistency of the playing surface regardless of the equipment used so people are not breaking legs or turning ankles, consistency of bounce off the infield and ball roll or bounce on the soccer field. Points to consider include:

• Spacing is important. With a wind of 5 mph, in 65 feet you are losing 12% of your performance.
• Correct soils and proper turf – we don’t want water on the warning track.
• How much water is at the source?
• Set the system properly so that you only get water where and when you need it.
• Scheduling for events and drying out for the big event.
• Replace only the amount of water lost through evapotranspiration – evaporation lost through the sun and transpiration lost through the plant.
• Set the controller for seasonal use – less water needed in the spring and the fall. In summer, more water may be needed. Re-calculate the controller for the time of the year and weather conditions.

Employees should be trained to check sprinklers to make sure the are not plugged, that they are turning, are installed at the right height and are working perfectly. It’s easy to put a gauge on the controller. For around $35, you can check if your system is losing pressure and if you have a leak somewhere. No matter how well you have prepared your system for winter in fall, when you start up in spring don’t turn on a single sprinkler until you can turn on as many quick couplers as you can and flush the system for at least a day, because in the winter all the corrosion and algae inside the pipe dries out and falls down. As soon as you turn on the first sprinkler, all that material will head to the first sprinkler or valve. There’s a chance you will have trouble with them all season unless you take them apart and clean them.

Fertilizer
Julie Glendinning, Marketing Coordinator, Nu-Gro Corporation, Professional Turf Product Division

Julie stated that what fertilizer you buy will depend on the kind of analysis you get for your crop. Proper fertilization enables turfgrass to maintain good colour, density and vigour, and allows it to resist diseases, weeds and insects more successfully. There are 16 different mineral elements essential to the growth of turfgrass – nitrogen is by far the most important. It has a dramatic impact on turfgrass colour, growth, density, tolerance to stress and recuperative power. Yet nitrogen is the mineral that is most often in short supply. If turfgrass doesn’t have enough nitrogen, it will stop growing and turn pale and yellowish. That’s why turfgrass benefits from a fertilizer with a reliable nitrogen source.

In general, synthetic nitrogen falls into one of three categories: 1) quick-release, water-soluble sources; 2) slower-release, coated surfaces; and 3) controlled-release reacted sources. Distribution of the fertilizer product is dependent on granule size.
