"We work closely with Dr. Kevin Mathias, an entomologist in our area."

"I've requested an on-site weather station so we can get better degree day readings. We have been using Merit with excellent results. Using IPM with the new insecticides has been very effective. IPM is one of the reasons to improve our irrigation system."

Paying attention, whether by satellite or by walking the course, is the most important key to insect control, say these superintendents. They welcome new technology, but keep close, personal observation on top of the list.

**In Future Issues**
- Magnesium for turf
- Brown patch modeling research
- Mechanisms of disease resistance

**CD-ROM team wins**

American Phytopathology Society members Gail Schumann and Jim MacDonald have received an Award of Excellence from the National Association of Colleges and Teachers of Agriculture, for the Turfgrass Diseases: Diagnosis and Management.

The CD has been available for more than a year, and contains visuals of more than 65 turfgrass diseases and disease agents.

"We are very pleased to receive this award from NACTA," says Dr. Schumann, associate professor and turfgrass pathologist at the University of Massachusetts.

"We've had a very positive response from turf managers who use the CD-ROM in their day-to-day operations," says Schumann, "but it is particularly gratifying that our teaching colleagues consider it a valuable instructional program.

"We worked hard to make a user-friendly, interactive program for both students and turf managers."

To order the CD-ROM ($169 plus $4 shipping) call APS at 612-454-7250.
