

2. Early morning irrigation also washes off disease promoting dew guttation.

3. Wind is usually lower and humidity higher in the early morning, which is conducive to a more efficient irrigation.

As indicated it is unfortunate that little information is available - for or against - nighttime watering. In personal communication with Dr. Robert Endo on this question, he definitely agreed that disease potential was greater with night irrigation but whether incidence occurred would be dependent on the overall vigor of the turf in question."

V. A. Gibeault

Dr. Gibeault wishes to announce the second annual Environmental Horticulture Field Day will be held at the South Coast Field Station, Santa Ana, on Tuesday, December 4, 1973. Starting time is scheduled for 1:00 p.m. The Field Day will feature ongoing research projects in turf-grass breeding and management, nursery production, weed control, growth control, and landscape plant introduction. There will be an opportunity to discuss the projects with program leaders.
