

down to acceptable levels. The low fertility level was taken heed of and an application of water soluble fertilizer was applied. Normally during the peak of summer, quick reacting fertilizers are avoided, but this proved to be the absolute curative as the turf responded favorably and within two weeks I was off the hook. The coming season will be the proof of the pudding as some changes have been made, most significant of which will be more careful watch of fertilizer applications and a lowering of the PH from a current 7.2 down into the 6's to try and avoid any similar problems.
