OWN THE DRAIN

continued from page 1 not intervene to stop the pollution. The liability does not stop at the superintendent, but carries on to the club managers, directors, owners, and course operators if they knowingly allow this pollution to continue.

The solution is to determine what types of compounds are being washed off, then implement the proper removal technique, and, finally, divert the water to a sanitary sewer line. Constructing a wash pad (wash rack) is a viable solution as long as it is engineered properly. The only negative drawback will be the ongoing need to retrofit as environmental laws change in the future and become more demanding.

The bottom line is, we ast get our "heads out of the sand NOW," and spend the dollars on remediation

before we are caught, fined, and forced to do the construction anyway -- or worse.

Institute Update

The brochure and registration form for the 4th Annual Golf Course Superintendent's Institute have been mailed.

If you have not received your application, please call Barbara at the office. Reservations must be made by October 29th.

The Pesticide Laws and Regulations seminar on November 3, will run from 1:00-5:00pm and will be followed by the tradeshow. Thursday offers a full day, with registration and trade show beginning at 6:30am, seminar series from 8:00am to 5:00pm, and dinner at 6:30pm.

Bubble Gum Sends Geese Packing

There's no accounting for taste: You may love the flavor of grape bubble gum or soda; some birds can't stand it. This fact may come to the rescue of landscapers, golf course managers, and anyone in charge of grassy expanses overrun by an exploding population of Canada geese. Graceful in flight, the goose is a loud, aggressive, voracious eater that can leave about a quarter of a pound of droppings a day.

The bubble gum flavor comes from methyl anthranilate (MA), a chemical that occurs naturally in Concord grapes and citrus blossoms. In synthesized form MA serves as a tasty food additive. Now it's proving to be a goose repellent.

Given a choice between untreated corn and kernels with MA, caged geese in experiments overwhelmingly rejected MA-laced kernels, says John Cummings, a wildlife biologist with the U.S. Department of Agriculture's Denver Wildlife Research Center.

Cummings is helping to develop an MA-flavored microcapsule that can be sprayed on grass and remain viable for 40 days, compared with today's limit of 15. Long-lasting MA is needed to ward off both resident birds and migratory geese that join them spring and fall.

Tips from the USGA Magic Beans

by Paul Vermeulen, USGA Agronomist

Stranger things have happened than the story I am about to tell. months ago I was in Phoenix visiting with a friend when I took a my first sip of 100% Colombian coffee, Yuban to be exact. If you drink as much coffee as I do to get through the first few hours of each day then you probably, like myself, are a connoisseur of fine coffee beans from around the world. If that is the case, the flavor of Yuban is just simply hard to beat.

Now having adopted Yuban as my coffee of choice, I noticed a small patch of hybrid bermudagrass just off the edge of my patio. Not that hybrid bermudagrass isn't wonderful to begin with, but this patch was especially dark green. (No, I do not own a female dog!) After some serious investigation discovered, much to my surprise, that the dark green patch just so happened to be the direct result of a coffee spill. And not just any coffee spill mind you, but Yuban, 100% Colombian coffee percolated with Costa Mesa municipal water.

As it turns out, it seems that coffee beans grown in certain regions of Colombia contain a unique enzyme that breaks down the organic molecules of ordinary thatch and, as a consequence, nitrogen is released into the soil. Many of you readers are probably already aware that the breakdown of certain humic acids is currently of intense interest to the scientific community, as it may be the key to lessening our dependence on fungicide applications.

Do you feel something starting to pull on your leg? You should, but if not, pick up the phone and call: 1-MAG-ICB-EANS. My partner is standing by for your order of PAUL'S MAGIC COLOMBIAN BEANS for just \$19.95. And remember our slogan: "If you can't sleep because you're losing your greens, then just be happy and spray, spray, spray with Paul's Magic Colombian Beans."

What's the point? The point is that it has been a long summer and I have watched several people take a "leap of faith." Like spraying magic potions that are supposed to cure greens of whatever ails them, as opposed to employing sound agronomic practices. Unfortunately, even though spraying magic potions may not cause any direct harm to the turf, such acts can erode our (mine included!) collective professionalism! As an example, can you even begin to imagine what
